ACKNOWLEDGMENT.

To the employing public, who have come to realize that the work of the Bureau is aimed at the improvement of the social and economic conditions of the bulk of our population, and who have shown a willingness to assist rather than resist the officers of the Bureau: To the District Attorneys, Police Departments, Probation Officers, Attendance Officers, and other officials who have rendered valuable assistance in the enforcement of labor laws: To the Judges of the higher and lower courts, who have upheld and made effective those laws designed for the protection and uplift of the women, children and men who must labor: To the official staff of the Bureau, whose loyalty and careful work are largely responsible for the results achieved: To each and all of them I tender my thanks.

JOHN P. McLAUGHLIN,
Commissioner.

LETTER OF TRANSMITTAL.

State Bureau of Labor Statistics,
San Francisco, October 21, 1912.

Sir:

I have the honor to submit the Fifteenth Biennial Report of this Bureau.

Respectfully,

JOHN P. McLAUGHLIN,
Commissioner.

His Excellency Hiram W. Johnson,
Governor of California.

FINANCIAL STATEMENT

For the Sixty-second Fiscal Year ending June 30, 1911, and the Sixty-third Fiscal Year ending June 30, 1912.

SIXTY-SECOND FISCAL YEAR.

Appropriations.

Salary of Commissioner	$3,000 00	
Salary of Deputy Commissioner	2,400 00	
Salary of Assistant Deputy Commissioner—Los Angeles	2,100 00	
Salary of Statistician	2,100 00	
Salary of Stenographer	1,200 00	
General appropriation	7,500 00	
Rent fund	1,200 00	
Printing fund	2,500 00	
Balance from sixty-first fiscal year, including $232.00 in printing fund	246 80	
Total amount available		$22,246 80

Disbursements.

Salary of Commissioner	$3,000 00	
Salary of Deputy Commisioner	2,400 00	
Salary of Assistant Deputy Commissioner—Los Angeles	2,100 00	
Salary of Statistician	2,100 00	
Salary of Stenographer	1,200 00	
General appropriation—For salaries of special agents, contingent and traveling expense	7,514 80	
Office rent	1,200 00	
Printing—Fourteenth Biennial Report, stationery, etc	2,732 00	
Total disbursements		$22,246 80

SIXTY-THIRD FISCAL YEAR.

Appropriations.

Salary of Commissioner	3,000 00	
Salary of Deputy Commissioner	2,400 00	
*Salary of Deputy Commissioner—Los Angeles	2,400 00	
Salary of Assistant Deputy Commisioner—Los Angeles	2,100 00	
Salary of Statistician	2,100 00	
Salary of Stenographer	1,200 00	
General appropriation	7,500 00	
Rent fund	1,800 00	
Printing fund	3,000 00

Disbursements—Year ending March 31, 1912	3,998 43
Balance on hand—March 31, 1912	$6,334 84

SUMMARY.

The Bureau of Labor Statistics was established in 1883, and until recently its work had been confined principally to the gathering and compilation of statistics. Only four laws contained any provision for their enforcement by the officers of the Bureau and as a result the bulk of the labor laws of our State remained dead letters. Under the present administration the Bureau has departed from the old-fashioned ideas and time-worn methods pursued by similar Bureaus, and has placed a new interpretation on the purposes for which such a Bureau should be maintained. We have undertaken the enforcement of all laws affecting labor, even though no provision has been made for this work and we have endeavored to cover as much of the field as our limited funds would permit.

For the first time in the history of this State, the working men and women have a place to go to tell their story and obtain advice and assistance without cost when they have been deprived of the wages they have honestly earned; when they have been defrauded by schemers or unscrupulous employers; when they have been shuttlecocked about the country through misrepresentations by employment agents and others, or when they have been made the victims of a multitude of other abuses.

The men and women who must earn their living by the sweat of their brow have not the time or money to resort to the courts in order to obtain redress from such wrongs. Therefore, the Bureau has in reality become, in a degree, a poor man's court; a place where he can be heard and where his case can be disposed of quickly and without cost.

In carrying out this work, the Bureau stands as one of the most important institutions tending to the social betterment of the people of this State. It tends to prevent men who have been denied their wages by employers after having earned them, from becoming embittered against society in general, and from being forced, by lack of money, to commit crime. It tends to prevent the working girls and women from being cast out upon the community without funds, and their being forced into a life of shame.

The Bureau in all this work has adopted a policy of absolute fairness in deciding questions between employer and employee, and it has always been the aim to have both parties go away with the conviction that they have had a square deal, and with a better understanding of their obligation toward each other.

The Bureau has wiped out the pay check evil as it formerly existed in this State. To-day every man and woman employed must be paid in coin or negotiable paper, payable upon demand without discount at some bank or other established place of business. No longer can employers pay off in time checks, payable in one or two, or sometimes, six months; or discount their own checks for ten or twenty per cent when cash is desired; or compel men to cash their pay checks in saloons owned or controlled by the employer. The firms that were most notorious for these practices and who defied the courts, to-day pay their employees full wages regularly, and if a dispute arises, they answer the citations of the commissioner promptly and abide by his decisions.

The wage collection agencies have been practically driven out of business and to-day, when men and women have wages due them, they get the entire amount, not ten or twenty per cent of it, as was formerly the case, when the collection agent would charge fifty per cent for collecting wages and make the employee pay the cost and expenses. The Bureau has compelled the payment of wages in amounts as small as sixty cents and as large as $300.00. While sixty cents may seem trifling, it was sufficient to keep a man from starving or seeking charity. In the past year the Bureau has collected upwards of $25,000 in wages for the working people of this State.

The Bureau has brought the employment agencies absolutely under its control, and now a person seeking employment need have no fear that he or she is going to be fleeced by such agents. If any employment agent misrepresents conditions to a person seeking employment, he is compelled to return the fee paid and the expense incurred. During the past year, the Commissioner has ordered the return of over $1,500.00 in fees and expenses for misrepresentations to persons looking for employment. In addition to this the agents have been ordered to furnish other positions without charge, in several hundred cases.

The theatrical booking agencies have been brought under control and one of the most vicious practices has been practically wiped out, namely, the stranding of chorus girls and actresses in strange towns, without funds or friends to take care of them.

The eight hour law for women has been enforced to such a degree that few employers in this State will now take a chance of violating it. By the strict enforcement of this law, the working women of our State have been raised to a higher plane than their sisters in the other states of the Union.

Under the present administration the child labor law was for the first time placed upon a sound foundation, and the work that has been done during the past year will for all time to come, prevent child labor from getting a foothold in this State. The child has been practically eliminated from the factory, workshop and store, and the school attendance has been swelling as a consequence. During the year ending June 30, 1912, the attendance in the public schools of the State increased 20,147. A firm respect for the child labor law has been instilled into the minds of employers, and no one would care to be accused of employing child labor.

Since the Bureau has undertaken the enforcement of the laws requiring temporary floors in buildings under course of construction, the number of deaths caused by falls, in the ranks of structural ironworkers, has been reduced seventy-five per cent.

As stated before, the Bureau has undertaken the enforcement of all labor laws upon the statute books of this State, notwithstanding the fact that only in four instances is any provision made for their enforcement.

In order to accomplish all these things and to enforce the laws so that they would be of real benefit to the people, the Bureau was obliged to undertake 173 prosecutions during the past year, in addition to the many thousands of cases where the evils were corrected by warnings.

In turning our attention to the enforcement of labor laws, we have not neglected the gathering and compilation of statistics, or the inspection of factories and stores, as will be shown by a perusal of part two of this report, which is devoted to statistical tables.

The following tables are submitted in order to show at a glance what has been done in the enforcement of laws by this Bureau during the fiscal year ending June 30, 1912, the present commissioner having taken office March 1, 1911.

Record of Prosecutions by this Bureau during the fiscal year ending June 30, 1912.

Nature of offense.	Total for State.	San Francisco office.	Los Angeles office.	Disposition of cases.		
				Convicted.	Dismissed.	Pending.
Child labor law	32	25	7	16	15	1
Eight hour law for women	72	50	22	44	17	11
Payment of wages law	12	5	7	1	10	1
Pay check law	3		3		1	2
Employment agents — Advance fees	2	2		1	1	
Employment agents—Licenses	6	4	2	5	1	
Misrepresentation as to strikes	3	3		2	1	
Blower law	3	1	2	1	2	
Ten-hour law for drug clerks	1		1	1		
Weekly day of rest law	9	5	4	9		
Totals	143	95	48	80	48	15
*Vending at night law	30	30			30	
Totals	173	125	48	80	78	15

*These cases were against newsboys, and this Bureau did not desire to obtain convictions against the boys. The arrests were made more in the nature of a warning.

Record of Complaints filed in Bureau and investigated during fiscal year ending June 30, 1912.

	Total for State.	San Francisco office.	Los Angeles office.
Non-payment of wages	1,899	1,274	625
Eight-hour law for women	622	466	156
Employment agencies	487	345	142
Child labor	150	104	46
Blowers	61	30	31
Sanitation	62	45	17
Scaffolding, flooring, etc.	14	13	1
Weekly day of rest	29	24	5
Public work	6	4	2
Ten hours for drug clerks	5	5	
Seats for females	1	1	
Totals	3,336	2,311	1,025

Disposition of Claims filed for non-payment of wages for year ending June 30, 1912.

	Claims filed.	Claims collected.	Amount of wages collected.
San Francisco Office	1,274	865	$16,899 44
Los Angeles Office	625	427	7,546 15
Totals	*1,899	1,292	*$24,445 59

*This only represents individual claims and does not include groups involving large sums, which would swell the total to over $50,000.

Disposition of Claims against employment agencies for year ending June 30, 1912

	Complaints filed.	Fee and expenses ordered returned.		New positions furnished.	Dismissed.
		Number.	Amount.		
San Francisco Office	325	248	$1,157 15	15	62
Los Angeles Office	141	117	313 15	18	6
Totals	*466	365	$1,470 30	*33	68

*In addition, several hundred new positions were ordered furnished, in cases where there was a slight misunderstanding, and no record was kept of these, as they were settled by telephone.

RECOMMENDATIONS.

The recommendations suggested herewith are the results of over a year's experience in the enforcement of the labor laws of this State. These recommendations are presented only after careful investigation and thought upon the subjects covered; and we urge upon the legislature the enactment of laws adequate to meet the conditions described.

CHILD LABOR.

Statutes of 1911, chapter 688, prohibiting any minor under the age of eighteen years, to vend and sell goods, engage in or conduct any business between ten o'clock in the evening and five o'clock in the morning, should be amended to prohibit any child under the age of twelve years from engaging in any of the above mentioned pursuits at any time, and to prohibit any child under sixteen years of age from engaging in them after eight o'clock in the evening. The penalty should be imposed upon the parent, guardian or person having charge or care of the child.

One of the most deplorable sights in our large cities is the child of six or seven years of age selling chewing gum, matches and papers upon the streets, up to ten o'clock at night. These children are mostly of foreign parents and it is absolutely necessary at this time to prevent this evil, in view of the increase of our foreign population after the opening of the canal. Conditions at present are such, that the children take their wares to school with them, so as to lose no time in getting to the business centers to start their work. We have found children selling on the streets within two or three minutes after the schools let out. These children often remain on the streets until eight or nine o'clock before going home to their evening meal.

The child labor law, Statutes of 1905, page 11, as amended, Statutes of 1911, Chapter 456, should be amended by providing for a special certificate permitting children under the age of fifteen years to work, providing they had completed the prescribed grammar-school course or its equivalent. At the present time this Bureau is issuing such a certificate in order to overcome a conflict between the child labor law and the compulsory education law.

BUREAU OF LABOR STATISTICS.

The act creating the Bureau, Statutes of 1883, page 27, should be amended with a view to enlarging the powers of the Commissioner to meet the present-day conditions. At present no provision is made for the enforcement of labor laws of this State, except in four instances.

A new section should be added, making it the duty of the Commissioner to enforce all labor laws now or hereafter in effect, and giving the officers of the Bureau the necessary power to enforce them. Provision should be made for the registration of all factories operating in this State, so as to facilitate the work of inspection and to enable the Bureau to keep a record of the growth of the industries of our State. Adequate appropriations should be made to meet the increased work of the Bureau.

WAGE CLAIMS.

The work of handling wage claims by this Bureau has grown to such proportion that it will be practically impossible for us to take up all these claims. Two courts should be established—one in San Francisco and one in Los Angeles—whose duty it shall be to decide claims involving wages. A mode of procedure especially adapted to this class of claims should be provided and no fees should be charged in claims amounting to less than $100. Only one continuance should be granted to either party and a decision should be rendered within ten days from date of filing. In all other cities and towns the justices' courts should try cases involving wages, and a special procedure should be provided for such cases, similar to those to be used in San Francisco and Los Angeles.

In the chapter entitled "Payment of Wages" will be found a description of the methods now employed by this Bureau in handling wage claims; also a statement of what has been accomplished in the past year.

EMPLOYMENT AGENCIES.

The present laws regulating employment agencies, Statutes of 1903, page 14, and Statutes of 1909, page 191, should be amended with a view to obtaining uniformity in the issuance of receipts and the keeping of registers; also providing for the bonding of agents and the regulation of theatrical booking agencies, all of which are described in the chapter entitled "Employment Agencies."

FACTORY INSPECTION.

California at present has no adequate legislation for the protection of persons working in factories. What has commonly been called our factory inspection law, Statutes of 1889, page 3, is practically of no value. A comprehensive law should be enacted and such law should cover, among other things, the protection of employees operating machinery; the kind and location of stairs, doors and fire escapes; the size, ventilation, sanitation and lighting of work rooms; the number, location and care of wash-rooms and toilets; the inspection and operation of elevators, chutes, and conveyors, and the inspection of boilers.

While at the present time we are not confronted with the problem of tenant-factories, some provision should be made to prevent this undesirable system from ever getting a foothold in this State.

The inspection should extend to mercantile establishments and to all other places where labor is employed; also to theatres, places of amusement, and especially moving picture shows.

Provision should be made for a sufficient number of factory inspectors in order to make the law effective.

INSPECTION OF LABOR CAMPS.

Some of the labor camps maintained by companies and contractors in building railroads, highways and other construction work in this State are kept in an insanitary and unhealthful condition and are a source of disease. A law should be enacted providing for the inspection of these camps, making the company, contractor or person in charge responsible for their cleanliness, and giving the Commissioner of the Bureau the right to condemn a camp, if, after investigation, he is satisfied that it is dangerous to the public health.

MINE INSPECTION.

In mining—one of the largest and most important industries in our State—the men employed are practically without any protection. Some laws have been passed, but no provision was ever made for their enforcement. While investigating an accident at the Bunker Hill Mine, where sixty-eight men were entombed from 6.45 a. m. on February 7, 1912, to 12.55 p. m. on February 8, 1912—or a period of thirty hours—we found an utter disregard for the protection of the lives of the miners. In this case, the accident had been caused by the breaking of the steel cable which released the skip and caused a cave-in below the collar of the shaft at a depth of about eighty feet. In this mine no attention had been paid to the law, Statutes of 1871–72, page 413, providing for escape shafts. At one time this mine did have a 1900-foot tunnel leading out at the 200-foot level, but it had been allowed to cave in. It developed upon further investigation that many mines in the same vicinity were also violating the law, and the Bureau secured the services of J. W. Atkins, a mining engineer, to make a special investigation. Mr. Atkins spent a month visiting the principal mines on the Mother Lode, and the results of his investigation are on file in the office of the Bureau. This report shows many flagrant violations of the present laws and practically a total disregard for the safety of the miners. Provision should be made for the appointment, by the Commissioner of this Bureau, of a competent mine inspector, whose compensation should be sufficient to insure the services of a man with the necessary technical and practical training.

EIGHT HOUR LAW IN MINES AND SMELTERS.

In view of the decision of the Supreme Court, *Ex parte Martin*, 106 Pac. Rep. 235, in which the court states that "It may be questioned whether, in view of the title of the act, the limitation of hours applies to all underground work or only that performed in mines," we believe that the title of the present law, Statutes of 1909, page 279, should be amended so as to include all that is now contained in the body of the act. Section 1 of the act provides: "That the period of employment for all persons who are employed or engaged in work in underground mines in search of minerals, whether base or precious, or who are engaged in such underground mines for other purposes, *or who are employed or engaged in other underground workings whether for the purpose of tunneling, making excavations or to accomplish any other purpose or design,* or who are employed in smelters and other institutions for the reduction or refining of ores or metals, shall not exceed eight hours within any twenty-four hours, and the hours of employment in such employment or work day shall be consecutive, excluding, however, any intermission of time for lunch or meals; *provided,* that in the case of emergency where life or property is in imminent danger, the period may be a longer time during the continuance of the exigency or emergency," whereas the title to the act now reads "An act regulating the hours of employment in underground mines and in smelting and reduction works."

PROTECTION OF WORKMEN ON BUILDINGS.

While under the present law, Statutes of 1909, page 157, as amended, Statutes of 1911, Chapter 590, providing for temporary floors, the loss of life has been greatly reduced—the secretary of the structural iron workers reports a decrease of seventy-five per cent in the number of deaths due to falls since this Bureau undertook the enforcement of this law—we suggest that some effective method of enforcing the provisions of the act be provided. The Commissioner of this Bureau should be given the power to condemn a building not properly planked, and to prohibit any person from working on such building until the necessary planking is provided.

ALASKA SALMON CANNERIES.

About five thousand men are hired in San Francisco every year to work in the salmon canneries in Alaska. These men return to San Francisco after the season's work and are paid off here. The abuses practiced in the employment and the paying off of these men are such as to demand some regulation on the part of the State. This subject is treated in the chapter entitled "Alaska Salmon Canneries."

SOCIAL STATISTICS.

The act, Statutes of 1905, page 109, providing for the collecting and compilation of statistics relating to marriage, divorce and crime, by this Bureau, should be repealed. In the first place, these subjects have no proper place in such a Bureau as this, as we cannot conceive any close relation between them and labor, while in the second place the State at the present time maintains two bureaus that are investigating similar subjects. The Bureau of Vital Statistics compiles statistics on marriage, and we believe is best qualified to handle the related subject, divorce. The State Board of Charities and Corrections is gathering statistics on crime, and our work at present amounts to practically a duplication of theirs.

PART ONE.

CHILD LABOR.

One of the most gratifying results of the work of this Bureau during the past two years has been the practical elimination of child labor in this State and the laying of a firm foundation for the enforcement of the child labor laws, with a view to prevent this evil from ever obtaining a foothold in California. Every child under the age of sixteen years that is working is doing so under a legal permit, with the possible exception of a few cases in isolated places that the officers of the Bureau have not had the opportunity to reach.

The number of children to whom permits have been issued has been kept down to a very small figure, and the Bureau has made it a point to see that those children legally employed are not engaged in any capacity that might prove injurious to their health or morals.

Even though we have the child labor situation well in hand, we cannot afford to relax our vigilance, for it is the general tendency of employers of child labor to become careless and gradually slip back into the old ways, and furthermore with the opening of the Panama Canal we will have to guard against the employment of the children of immigrants, for to-day our greatest trouble lies with the children of foreigners.

When we undertook the enforcement of the child labor laws we realized that it was necessary to lay out a general plan of action. This plan contained the four courses that we determined were necessary to make the laws effective and which are:

First—A systematic and uniform issuing of certificates and permits, by a designated person, which person shall be responsible for the proper issuance and obliged to keep accurate record thereof.

Second—A coöperation of all the members of the school departments, juvenile court and probation officers, attendance and truant officers with the Bureau in carrying out the provisions of the law.

Third—A wide publicity, so that the employer is ever reminded of his liability, and the public of their responsibility to observe and report violations.

Fourth—An inspection, at short intervals, of all establishments that are apt to employ children. With this general plan the Bureau undertook the work of making the child labor law of this State something more than an ornament in the statute book.

The first thing we did was to make an inspection of about one thousand establishments in the cities of San Francisco, Los Angeles and Oakland, as a preliminary survey. During these inspections we found that many children were at work without permits, but the important fact disclosed was that most of the permits on file in the various establishments had been issued in violation of the law, while many had expired as long as five years before and did not belong to children then employed.

We found that it had been the custom for teachers and principals to issue age and schooling certificates indiscriminately, without regard to the age or schooling requirements. Often the certificates had been handed to the children in blank and were filled out by their parents and never returned to the school for verification or recording. We also found several blank certificates on file with employers, and in one instance we ran across a certificate in which the age and schooling requirements were certified to by the corner grocer.

In the course of these inspections we gathered up over 3,000 certificates and permits which had expired or had been illegally issued. If we found children of the legal age holding an improper certificate or permit we compelled the employer to obtain a new one, and if the children were under the legal age we sent them back to school.

This preliminary investigation convinced us that the greatest fault lay with the persons issuing certificates and further that there were too many permitted to issue them, and that no proper records were kept. We, therefore, proceeded to place a strict interpretation upon section 3 of the child labor law, and insisted that only one person in each city or school district be permitted to issue an age and schooling certificate. We then prepared and had printed all the certificates and permits required under the provisions of the act and had these certificates numbered in original and duplicate. The certificates and permits were then sent to all persons in the State entitled to issue them and a record was kept in our office of their numbers, so that in the event of our finding a certificate improperly issued we could determine who was at fault.

Blanks were also prepared on which the persons issuing certificates were obliged to report to the Bureau the record of each certificate issued. The same was done in the case of the Juvenile Court Permits, which are issued by the judge of the Juvenile Court to children between the ages of twelve and fifteen years when one of the parents is incapcitated by illness from supporting the children. The record of these permits is kept by the probation officer.

A pamphlet containing all the laws pertaining to the employment of children was compiled and a circular of instruction prepared. These were then mailed to all persons authorized to issue certificates or permits:

BUREAU OF LABOR STATISTICS.

STATE OF CALIFORNIA.

948 MARKET STREET. SAN FRANCISCO.

Circular No. 1—Child Labor Law.

At the recent session of the legislature many changes were made in the Child Labor Law. This circular has been issued for the purpose of bringing these changes before the persons who have to deal with this law, in order to aid in its enforcement by establishing a systematic policy and to state interpretations placed upon the law and the policy of this office in the enforcement of same. The principal changes are as follows:

The *Juvenile Court Permit* will hereafter be granted to children between the ages of twelve and fifteen years instead of between the ages of twelve and fourteen years. These permits will be issued by the judge of the juvenile court of the county, or where there is no juvenile court, then by a judge of the Superior Court. All applicants for these permits should be referred to the Probation Officer.

The *Age and Schooling Certificate* will be granted to children between the ages of fifteen and sixteen years instead of between the ages of fourteen and sixteen years. These certificates will be issued by a city superintendent of schools or by a person designated by him in cities having a superintendent of schools, and in other places by a person authorized by the local school trustees. Principals or superintendents of schools of recognized standing have the right to approve age and schooling certificates, but we recommend that they refer all applicants to the persons designated by the public school officials. We request that the city superintendent of schools and the local school boards immediately designate a person within their jurisdiction to issue age and schooling certificates and to furnish this office with the names of persons so designated. The persons so designated must not issue a certificate unless the child presents a written request from a prospective employer of such child that an age and schooling certificate be granted to such child.

The *Vacation Permit* will be granted to children over twelve years of age to work during the *regular vacation* of the public schools. These permits will be issued by the principal or vice-principal of the school, or secretary of the board of school trustees, or board of education of the school which such child has attended during the term next preceding such vacation.

The Supreme Court in its decision on the Child Labor Law construes the vacation of the public schools and attendance during the term next preceding such vacation as follows:

> "Its true meaning is that the permit is to be given by the principal of the school which the child has attended—whether the school is public or private—but that it can extend only to the time of the public school vacation."
>
> "The amendment of March 20, 1905, extends the time of such compulsory attendance so as to embrace the whole period of the public school session. Therefore, if the parents, guardians, or custodians of a child choose to send it to a private school it must attend thereon at least during the time the public schools are in session. A permit may be obtained for it to work during the vacation of the public schools if its interests or necessities so require, without subjecting it to conditions substantially different from those affecting children attending the public schools."

The Attorney General, in an opinion furnished this office, states that *Saturdays are not* "regular vacations" within the meaning of the law.

No permit of any kind is required for any minor employed at agricultural, horticultural, or viticultural, or domestic labor, during the time the public schools are not in session, or during other than school hours. Horticultural includes the curing and drying, but not the canning, of all varieties of fruit.

A new section—designated section 3*a*—was added to the Child Labor Law providing that no child under sixteen years of age shall, while the public schools are in session, be and remain idle and unemployed for a period longer than two weeks, but must enroll and attend school, and provides for a notification by the employer to the proper authorities when the child leaves his employ.

The officers and agents of this Bureau will recognize as valid, all certificates issued under the provisions of the Child Labor Law prior to its amendment. The amendments became effective June 13, 1911.

Th's office has prepared and printed the necessary permits and certificates and will furnish them to persons authorized to issue same. Age and schooling certificates and vacation permits will be sent to city superintendents of schools for use in cities, and to county superintendents of schools for distribution throughout the county. Juvenile court permits will be sent to the probation officers of each county. We trust that you will coöperate with this Bureau and thus obtain the best results in carrying out the provisions of the Child Labor Law.

BUREAU OF LABOR STATISTICS,
JOHN P. MCLAUGHLIN,
Commissioner.

The second step was to send copies of the laws and instruction to the various school departments, probation and attendance officers. We also held several conferences with them and made personal visits to as many as possible, all with a view to obtain their coöperation.

In seeking a wide publicity we sent copies and digests of the laws pertaining to employment of children to the principal newspapers through the State and requested that they be published. We also delivered copies of the law to the thousands of employers in the larger centers of industry.

After these first three steps had been covered and enough time had elapsed to put them into effect, we began a thorough inspection of establishments in the cities of San Francisco, Los Angeles, Oakland, Sacramento, San José, Stockton, San Diego, and then branched out to as many other places as time and funds would permit.

In the course of this second investigation a record was taken of the name and age of every child found working, together with the number of the certificate under which he or she was permitted to be employed. Several violations were found, but they were for the most part only technical and were immediately corrected.

That our work has been successful we leave to the public to judge from the following figures:

Total number of establishments inspected	5,123
Total number of employees	148,549
Total number of children under 16 years	1,331
Percentage of children to total number of employees	0.9 per cent

The number of children under 16 years of age, therefore, constituted less than 1 per cent of the total number of persons employed. A further analysis of our figures shows as follows:

Children between 15 and 16 years working under an age and schooling certificate	1,071
Children between 12 and 15 years working under a juvenile court permit (which is only issued for a temporary period)	260
Total	1,331

Of the children between the ages of 15 and 16 years, 761 were boys and 400 girls, while of those between the ages of 12 and 15 years, 207 were boys and only 53 girls. Retail establishments employed 55.4 per cent of all the children under 16 years of age. Wholesale establishments employed 6 per cent and manufacturing establishments 37.7 per cent.

If the enforcement of the child labor law has been effective, the results must show in one place in particular and that is in the public schools. Let us now look for this effect in the enrollment and attendance in the last year and compare it with former years:

NOTE.—Figures in detail are given in chapter on Child Labor Statistics.

Enrollment Primary and Grammar Schools, State of California.

Year ending June 30.	Enrollment.	Increase over preceding year.	Per cent of increase.
1909	312,222	13,297	4.4
1910	322,361	10,139	3.2
1911	334,655	12,294	3.8
1912	356,945	22,290	6.7

Average Daily Attendance Primary and Grammar Schools, State of California.

Year ending June 30.	Average daily attendance.	Increase over preceding year.	Per cent of increase.
1909	244,621	12,296	5.3
1910	252,321	7,700	3.1
1911	263,402	11,081	4.4
1912	280,485	17,083	6.5

During the year ending June 30, 1912, the enrollment in the primary and grammar schools of the State increased 22,290 as compared with an increase of 12,294 during the preceding year. The per cent of increase during 1912 was 6.7 per cent as compared with 3.8 per cent during 1911, 3.2 per cent during 1910 and 4.4 per cent during 1909. The average daily attendance in these schools increased 17,083 in 1912 as against 11,081 in 1911. The per cent of increase during 1912 was 6.5 per cent as compared with 4.4 per cent during 1911, 3.1 per cent during 1910 and 5.3 per cent during 1909.

That publicity has had its effect is shown by the number of complaints filed in the Bureau by the public. During the fiscal year ending June 30, 1912, 150 complaints were filed and investigated by the officers of the Bureau.

Child Labor Complaints Filed in Bureau and Investigated During Fiscal Year Ending June 30, 1912.

Industries complained against.	Total.	San Francisco office.	Los Angeles office.
Bakeries	6	3	3
Butcher shops	5	5

Tailors	12	5	7
Telegraph and messenger service	6	4	2
Theaters	24	17	7
Miscellaneous	33	23	10
Totals	150	104	46

In addition to these investigations the Bureau was obliged to bring 32 criminal prosecutions under the child labor law during the fiscal year ending June 30, 1912. These prosecutions were against persons who had been given a warning and had failed to heed it. The Bureau also brought action against 30 boys for vending between ten o'clock at night and five o'clock in the morning. These boys were taken before the Juvenile Court and given an admonishment. We did not desire that any record of conviction should stand against the boys, but only desired to break up the practice of young boys being on the streets when they should be in bed.

Owing to a conflict between the child labor law and the compulsory education law, the former provides that no child under 15 years of age shall be employed without a juvenile court permit, which can only be obtained when the parent or parents of the child are incapacitated from labor through illness, and the latter that any child under 15 years of age need not attend school if he or she has completed the prescribed grammar school course; we were obliged to issue a new permit, which we designated as a Temporary Work Permit. This permit is issued only by the Bureau upon satisfactory proof that the child has completed the grammar school course. During the fiscal year ending June 30, 1912, 181 of these permits were issued.

Temporary Work Permits Issued to Graduates of Grammar School, Under 15 Years of Age, Fiscal Year Ending June 30, 1912.

Age.	Total.	Male.	Female.
San Francisco—			
13 years	9	8	1
14 years	85	66	19
Totals	94	74	20
Los Angeles—			
13 years	9	8	1
14 years	78	52	26
Totals	87	60	27
Totals—			
13 years	18	16	2
14 years	163	118	45
Totals	181	134	47

The following tables give a record of these certificates and permits issued to children under 16 years of age permitting them to work under the provisions of the child labor law in the entire State, during the fiscal year ending June 30, 1912.

AGE AND SCHOOLING CERTIFICATES.

(Children between 15 and 16 years.)

Literate children—		
Male	1,260	
Female	651	
Total		1,911
*Illiterate children—		
Male	112	
Female	43	
Total		155
Total age and schooling certificates issued		2,066

Out of the total number of certificates issued 607 or 29.4 per cent were issued in the city and county of San Francisco, 790 or 38.2 per cent in Los Angeles County, 385 or 18.6 per cent in Alameda County, while the remaining 284 or 13.8 per cent were issued in the other 55 counties of the State. 1372 certificates or 66.4 per cent of the total were issued to boys and 694 or 33.6 per cent to girls. Of the 155 certificates issued to illiterate children 120 or 77.4 per cent were issued in Los Angeles County while only 13 or 8.4 per cent were issued in San Francisco and 20 or 12.9 per cent in Alameda County. Boys constituted 72.3 per cent of the illiterates and girls 27.7 per cent.

JUVENILE COURT PERMITS.

(Children between 12 and 15 years.)

Age.	Total.	Male.	Female.
12 years	26	25	1
13 years	88	75	13
14 years	212	166	46
Totals	326	266	60

Out of the total number of permits issued 142 or 43.5 per cent were issued in the city and county of San Francisco, 38 or 11.7 per cent in Los Angeles County and only 8 or 2.5 per cent in Alameda County. The remaining 138 permits or 42.3 per cent were issued in the other counties. 266 permits or 81.6 per cent of the total were issued to boys and only 60 or 18.4 per cent to girls.

These juvenile court permits are only for a limited period of time. The following table shows the length of time for which permits were issued:

Less than 1 month	12
1 month up to 3 months	38
3 months up to 6 months	138
6 months up to 1 year	89
1 year and over	47
Indefinite	2
Total	326

---

* Illiterate children are obliged to attend night school and must furnish employers with a certificate of attendance.

It will probably have been noticed that the number of all certificates and permits issued exceeds the number of children we found working in establishments inspected. This may be accounted for in many ways. In the first place we did not reach every establishment in the State during our inspection, nor did we inspect the offices of attorneys and other professional men who employ several children under sixteen years of age, but the principal reason is the fact that a large number of children obtain permits and only use them for a short period of time, or use them to work after school or on Saturdays for delivering newspapers. or use them in place of a vacation permit and then return to school. This investigation did not include the children working during the school vacations, the majority of whom are employed in the agricultural industries.

PAYMENT OF WAGES.

The legislature of 1911 enacted two laws that stand out as milestones in the cause of improving the conditions of those that depend upon their wages for their existence. These two laws are what are commonly known as the payment of wages law and the pay check law. The former provides for the payment of wages earned, immediately upon the discharge of an employee, or within five days, when an employee quits or resigns. It also provides for a monthly pay day and prohibits the withholding of wages for more than fifteen days. The latter law provides for the payment of wages in cash or in negotiable paper, payable upon demand without discount at some bank or established place of business in this State.

The legislature, however, failed to make any provision for the enforcement of these laws or to make any appropriation to defray the cost of enforcing them; and, like many other laws, they would have remained dead letters upon our statute books. This Bureau, however, appreciated their importance and immediately undertook to put them into effect, but we realized at the start what an enormous task lay before us; in fact, the collection of wages has taken up the bulk of our time and has made heavy inroads into our funds.

During the fiscal year ending June 30, 1912, 1899 claims for wages were filed in the Bureau, and investigated. We succeeded in collecting 1292 of these claims, amounting to $24,445.59. These figures represent only the individual cases handled by the Bureau and do not include those involving large numbers or groups which were settled at one time. If we included the latter the amount would run to over $50,000. For example, we had a case in which a large contractor failed and left his men stranded upon the work with wages amounting to over $5,000 due them. We called a conference with the attorneys for the principals, the contractor and the bonding company, and after a series of meetings it was agreed that the bonding company would continue the work and protect the claims of the laborers.

If the claimants had been compelled to resort to the collection agents for the collection of their wages, they would have received less than $5,000 out of this amount; for, in the first place, over one half of the wage claims were so small that a collection agent would not handle them, and, in the second place, the cost of collection would have amounted to over 50 per cent of the amount involved. Furthermore, the usual methods of collecting wages would take two or three months, whereas in the wages collected by this Bureau the majority of claims have been settled in a space of three days after filing.

A typical case of the abuses that were practiced upon wage-earners by collection agencies was one in which a laborer turned over his claim for wages to an agent for collection. The agent brought an action in the Justices' Court, and after a delay of about three months succeeded in collecting the amount due. The agent then sent the laborer a check for 50 cents as his share of the $20.00 wage claim he had presented, the remaining $19.50 having gone to pay costs and commissions.

The wage collection agencies have been practically driven out of business since this Bureau undertook the enforcement of the payment of wages law.

It will be rather interesting to note the methods pursued by the Bureau in the handling of these wage claims, and will give the reader an idea of the amount of work involved.

When a claim for wages is presented at the office of the Bureau, a record of the facts is made and a special agent is sent out to the employer to make an investigation. If the employer refuses to pay the wages claimed and cannot offer a satisfactory explanation, he is cited to appear before the Commissioner, at a certain day and hour. It has been found necessary to cite the employer in over 80 per cent of the cases. At the time set in the citation the case is taken up and heard, and both sides have an opportunity of being heard. If no settlement can be arrived at and the employer refuses to pay the amount of wages that has been determined upon as due the claimant, a citation is issued directing the employer to appear at the office of the district attorney, to show cause why a warrant should not be issued for violation of the provisions of the payment of wages law. When the case is called at the district attorney's office both parties are present, also a representative of the Bureau, and the claim is again taken up, and if the employer then refuses to pay the amount determined upon, a warrant is issued for his arrest. It has always been our earnest endeavor to avoid court proceedings and to arrive at an amicable settlement. A warrant for the arrest of the employer is only sought after all other means have failed, or where we have reason to believe that the employer intends to flee the jurisdiction. During the fiscal year ending June 30, 1912, we were only obliged to make twelve arrests for nonpayment of wages.

The Bureau in all this work has adopted a policy of absolute fairness in deciding disputes between employer and employee, and it has always been our aim to have both parties go away with the conviction that they have received a square deal, and with a better understanding of their obligations toward each other.

The collection of certain wage claims has often involved a great deal of work, time and expense when the employer has failed and his business is attached by creditors, or when he goes through bankruptcy. In these cases the Bureau has undertaken to make out and file the claims of the wage earner and to perform the necessary legal work involved. Our reason for assuming this additional work is that the wage earner has not the means to employ attorneys and as a consequence would be deprived of his earnings.

Our investigation into wage claims has brought to light some very interesting phases of the abuses to which the ignorant laborer is a victim. These may be termed Schemes to Defraud Labor, and include a number of clever schemes which have for their object the defrauding of labor under the guise of increasing their earning power, teaching them trades and giving them employment. The most vicious of these schemes was encountered in San Francisco in May, 1912, and a recital of some of the facts of the case will give a fair idea of some of the practices the unprotected laborer is made a victim of. On May 1, 1912, our attention was called to a Greek who was hiring men to perform common labor for an electric light and power company at the rate of $2.00 per day, whereas the prevailing rate of wages at that time for that class of labor was $1.75. Circulars had been printed in the Greek language and distributed widely, and hundreds of Greek laborers were leaving their work on railroad construction, where they were only receiving $1.75 per day, to apply for this new work. We obtained the service of a Greek laborer and gave him $2.50 with which to apply for a position. When he handed the fee to the Greek agent, our special agent stepped in and demanded that the Greek agent show his license to conduct an employment agency. He produced a small typewritten sheet which he claimed was his license. This sheet bore a memorandum of the number of a license that had expired on March 31st of that year. When questioned he stated that he had paid $60.00 for the license and then refused to make any further admissions. He was immediately placed under arrest and charged with conducting an employment agency without obtaining a license. We, however, realized at this time that there was something deeper involved in this case, and requested the court to raise the bail high enough so that we could hold this Greek agent and get at the real culprits. We first ascertained that there was no such company in existence as the one the men were being hired for, and there was no work whatever for them. When we confronted the Greek agent with these facts, he told us of all his dealings in the matter and it developed that he, himself, had been made a victim and had parted with over $500.

We then obtained warrants for the arrests of the two men who had concocted the scheme. These two men were very prominent in San Francisco, and every influence, both political and personal, was brought to bear in their behalf, but to no avail. The Bureau procured the services of the Hon. D. M. Duffy as special prosecutor, and after a protracted trail in the police courts they were held for trial in the Superior Court.

The trial disclosed that these two men had drawn up a fictitious contract with a fictitious corporation in which they were authorized to employ 3,000 Greek laborers. They showed this contract to the Greek agent and instructed him to go out and hire the men. The Greek agent was told to collect $2.50 from each man he hired and turn the money over to the two defendants. In consideration for his work he was to receive $500 and the job of general foreman over the laborers. The Greek agent knew that a license was necessary and told the defendants that he must have one. The defendants agreed to obtain one for him and he gave them $60 for that purpose. In place of securing a license for him they went to an empty store that had formerly been an employment agency and copied the number and name of the license and handed him this memorandum in lieu of a license.

On November 20, 1912, the defendants were found guilty of obtaining money under false pretenses and sentenced to three years imprisonment in the state penitentiary.

Fortunately this scheme had been nipped in the bud, but even though it had only been in operation one day, 148 laborers had been fleeced out of $2.50 each. If the Bureau had not taken such immediate action, 3,000 laborers would have been mulcted of $2.50 each, or a total of $7,500, and not alone this, but would have quit their jobs and rushed to San Francisco to get the increased pay that was offered.

Another of these schemes was what is known as cigar-making schools. Two of these institutions were thriving in San Francisco until the Bureau took a hand, and after a long campaign succeeded in putting them out of business. These so-called cigar-making schools were nothing more than schemes to fleece ignorant laborers—for the most part foreigners—who thought that they could improve their conditions by learning a trade. Attractive advertisements were placed in the newspapers and when the applicant applied he was told that he would have to pay $25.00 deposit to cover the cost of the material he consumed in learning, and that in a very short space of time he would be employed by the factory—which was always a part of the school—at attractive wages. The following is a copy of the contract which he was given upon payment of $25.00:

This Contract, made the -------- day of ------------, in the year one thousand nine hundred and ------,

Between the GOLDEN WEST CIGAR COMPANY of the city and county of San Francisco, State of California, party of the first part, and---------------, the party of the second part.

Witnesseth: that the party of the first part, in consideration of the covenants on the part of the party of the second part, hereinafter contained, hereby covenants with the party of the second part, that the party of the first part will in consideration of the sum of Twenty-five [25.00] Dollars to him in hand paid, by the said party of the second part, the party of the first part will teach the party of the second part the business of Cigar Making, including stripping, booking, packing, ringing, selecting colors, mold, hand and Spanish work.

And the party of the second part in consideration of the covenants on the part of the party of the first part hereinafter contained, agrees to and with the party of the first part that the party of the second part shall receive the first one thousand cigars he makes, for his time and labor and after the first 1000 cigars is made by the second party, he will be paid a certain wage per thousand, to be hereafter agreed upon.

And for the true and faithful performance of all and every of these covenants the parties to these presents bind themselves, each unto the other.

It is further agreed that in case the party of the second part fails to fulfill his part of the contract, he shall be entitled to the cigars he makes, nothing further.

It is further stipulated and agreed that the party of the second part will obey the factory rules of the first party.

In Witness Whereof, the parties have hereunto set their hands the day and year first above written.

GOLDEN WEST CIGAR COMPANY.

Signed and Delivered in the Presence of

------------------------------ ------------------------------

------------------------------ ------------------------------

This contract upon its face is quite plausible, but the persons operating these cigar factories figure that the applicant will become disgusted in a few days and quit, and under the terms of the contract is entitled only to the cigars that he has made, which, by the way, are made of such material that they are unfit to smoke. If the applicant persists in remaining and completes his first 1,000 cigars, he is either offered a ridiculously low wage or some excuse is found for discharging him.

A most novel scheme encountered was one that might be called a form of continuous agency. A case was reported to us by the local police department upon a report having been made by a young man who had parted with $20.00. According to the terms of the contract entered into, this young man was to become a "manager" for the company for the period of one year at a fixed salary, but the salary was not to start until he had secured at least six agents. These agents were obliged to pay a deposit of $5.00, of which the manager was to receive $2.50 and the company $2.50. The company furnished these agents with a sample case of pot-metal knives and scissors and cheap literature, all of which was practically unsalable. If the manager failed to comply with any of the provisions of the contract, he would forfeit his $20.00 and this amount would "be retained by said company as pay for instructions furnished."

The officers of this Bureau located the official representative of the company, and made him return the $20.00 he had received. We then took him before the district attorney and he was informed that he would not be permitted to operate in this State, even though the company which he was representing was a very large and wealthy one.

A rather peculiar case came to our attention and involved one of the large casualty companies. It appeared that shortly after the passage of the Roseberry Employers' Liability Act, the various casualty companies became very active in soliciting business in the mining districts, as most of the mining companies had refused to come under the provisions of the act. The mining companies seemed to look favorably upon the work of these casualty companies, in getting the miners to take out insurance against death, accident and sickness. During a visit of Mr. H. A. Scheel to Sutter Creek and vicinity, where he was making an investigation into a mine disaster, several miners appealed to him for relief from what they considered an unjust imposition by an insurance company. It developed that an agent of the company had come to the mine and had agreed to write a policy which provided for the payment of $400 in event of death, or $1.85 per day during sickness, and the appointment of a resident physician for the benefit of the policy holders. The amount to be paid by the miners was $9.00 for a period of six months, which amount was deducted from their wages.

The policies which these miners received were entirely at variance with the statements made by the company's agent. In the first place it provided only for $100.00 in event of death and $35.00 per month during sickness, and instead of being for six months was only for two months.

This Bureau immediately took up the matter with the State Insurance Commissioner, and on February 13, 1912, we made a demand upon the company for the return of $9.00 for each of the thirty-two miners who had been defrauded. The company at first agreed to make this refund, but requested time to make an investigation. After a month had elapsed, we again made a demand upon them and they stated that the matter was being adjusted. In the mean time we had learned that nothing had been done by the company. On April 8, 1912, we cited the local representative of the insurance company, and to our surprise he appeared with counsel and informed us that his company did not have to refund the money collected, as the policies had expired on April 1, 1912, and as they had run for the period of two months, the time which premium covered, the company had earned the premium on account of its liability during that time. We informed the local agent and his counsel that we did not propose to sit idly by and tolerate such sharp practice, and we again took up the matter with the Hon. E. C. Cooper, Insurance Commissioner. Mr. Cooper instructed the company that if the money was not returned he would order an investigation of the books of the company and in the mean time revoke their license in the State of California. The local representative of the company tried to bring pressure to bear, and even went so far as to call on the Governor of this State, where they received little comfort. The company then sent thirty-two checks for $9.00 each to the Insurance Commissioner, who, in turn, handed them over to this Bureau for distribution to the claimants.

One of the most prevalent forms of defrauding laborers of their wages occurs in the so-called ''wild cat corporations.'' These corporations, as a rule, maintain elaborate offices in the larger cities, and only pay the office force a samll part of the wages agreed upon, claiming that they are hard pressed for money and that they will soon be able to pay them. They pursue the same policy at their mines, oil wells, or other enterprises by furnishing the crew with just enough money for subsistence and informing them that the money for their wages will be forthcoming at a very early date. After a few months these wild cat companies evaporate, so to speak, and the employees are left with two to three months wages due them. As a rule, when we investigate these cases, we find a dummy board of directors or every one trying to shift the responsibility.

We have prepared the following table for the purpose of showing the occupations of the persons filing wage claims in the Bureau and also the industries in which most of the violations of the payment of wage law occur. It will be noted that the claims of those in the unskilled and unorganized branches of labor predominate. The claims of common laborers constitute 21.3 per cent, or over one fifth of all the claims filed by men, while those engaged in general housework make up 23.7 per cent of all the claims filed by women.

In the industries against which claims were filed, that of construction and general contracting work stands out the most prominent, with a total of 397, or 20.9 per cent of all the claims filed, while restaurants come next with 227 claims, or 11.6 per cent; then hotels, apartment and boarding houses with 178 claims, or 9.4 per cent, and private places or homes with 149 claims, or 7.8 per cent of the total. This last item is interesting and may be accounted for by reason of the fact that in many instances women will discharge their servants in a fit of anger and will refuse to pay them the wages earned.

Wage claims investigated during fiscal year ending June 30, 1912.

EMPLOYMENT AGENCIES.

At the present time there are two laws upon the statute books respecting employment agencies, the one Statutes 1903, page 14, providing for the general regulation of employment agencies and the other Statutes 1909, page 191, providing for the licensing of employment agencies. While these two acts have served the purpose of regulating the employment agencies to a marked degree, especially the act of 1909, we are convinced from our experience in enforcing these laws that far more stringent regulations are required, particularly in view of the influx of foreign labor after the opening of the canal.

The present laws should be amended by providing for a uniform receipt, the original of which should be given to the person seeking employment and the duplicate to be kept on file by the employment agent. At the present time a great deal of the disputes arise over the receipts that are issued, owing to the fact that they do not contain the information that the employment agent gives to the applicant orally, and which is essential to prove misrepresentation. Provision should also be made for the keeping of uniform registers by employment agents, which registers should contain a complete record of every transaction, in such form as to facilitate the work of checking up the reports of these agents, by officers of this Bureau.

We are satisfied that collusion exists between some employment agents and contractors, or their superintendents or foremen, but it is practically impossible to prove it. In order to put a stop to this collusion, we believe that provision should be made for the return of the fee by the employment agent when the employee is discharged within one week from time of employment, unless it is stipulated that the employment is for a period of less than one week.

The employment agencies should be required to furnish a surety bond when making application for a license, which is the practice in many eastern states, and the Commissioner should be given the power to revoke licenses when he is satisfied that the employment agent is not carrying on a legitimate business.

Special provision should be made for the control of theatrical booking agencies, as these agencies, when uncontrolled, represent one of the worst forms of abuse in the employment business. The contracts, which these agencies use, should all contain certain restrictions and requirements and should be approved by the Commissioner before the performer is employed, as is the practice in New York. The booking agents should be required to investigate the financial ability of the theaters or managers to pay for the talent furnished. One of the most deplorable conditions that we have encountered in our work has been the stranding of road shows by irresponsible managers. Young girls are left penniless hundreds of miles from home. The moral aspect of such a situation is too well known to require any description.

The following table shows the record of complaints against employment agencies filed in our Bureau during the fiscal year ending June 30, 1912:

Disposition of Claims against Employment Agencies.

	Complaints filed.	Fee and expenses ordered returned.		New positions furnished.	Dismissed.
		Number.	Amount.		
San Francisco office	325	248	$1,157 15	15	62
Los Angeles office	141	117	313 15	18	6
Totals	*466	365	$1,470 30	*33	68

*In addition, several hundred new positions were ordered furnished, in cases where there was a slight misunderstanding, and no record was kept of these, as they were settled by telephone.

That the Bureau—even under the present laws—has the employment agency problem well in hand is shown by the fact that the number of complaints in the last six months of the fiscal year reported was less than in the first six months, and furthermore, only $414.55 was ordered returned in the last six months as against $1,055.75 in the first six months.

In this report, under the chapter devoted to statistics on employment agencies, will be found—in a series of 37 tables—the first complete record ever made of the number of persons obtaining employment through these agencies, and the amount of fee they are obliged to pay for such employment. These tables also show the occupation and sex of the person given employment and the average fee paid by each classification.

The following figures give one an idea of the amount of business transacted by employment agents and at the same time lead one to realize the importance of controlling these agencies that handle the employment of close to 200,000 persons in a year, and from which persons is exacted the enormous sum of almost one half million dollars per year for the privilege of obtaining employment.

Employment Agencies.
(License Year ending March 31, 1912.)

Class of agency.	Total number of persons employed.	Total amount of fees collected.	Average fee.
Commercial	1,754	$24,369 85	$13 89
Female	15,749	37,431 45	2 37
General	150,241	238,026 10	1 58
Hotel	14,030	31,417 88	2 24
Nurses	236	941 55	3 99
Oriental	7,868	24,264 05	2 53
Teachers	1,220	38,756 36	31 77
Theatrical	1,983	*4,280 71	†2 16
Miscellaneous	1,327	3,576 34	2 70
Totals	194,408	$403,064 29	

*The report on theatrical agencies was not complete as these agencies had not all been brought under control of the bureau at that time. Their business at the present time amounts to about $60,000 per year.

†Average fee figured on basis of engagement of one week or less.

Of the persons employed through these agencies 84.7 per cent were males and 12.1 per cent females, while in 3.2 per cent of the cases no sex was stated; 35.1 per cent of the total number of persons were furnished positions through the agencies in San Francisco, 34.2 per cent in Los Angeles and 10.9 per cent in Sacramento, making a total of 80.2 per cent in these three cities. The average fee paid by men to the general employment agencies in San Francisco was $1.66, in Los Angeles $1.59, and in Sacramento $1.20. The average fee paid by women to the female employment agencies in San Francisco was $2.67 and in Los Angeles $1.93. The average fee charged by commercial agencies for furnishing clerical positions was $13.89.

Particular attention is called to the very large fees that are paid by school teachers. During the past license year, the teachers employment agencies collected $38,756.36 from 1,220 teachers, or an average of $31.77 for each position furnished. The injustice of the payment of such fees is more intensified when we consider that the persons paying them are employed by the people of this State. We believe that teachers should not be compelled to seek employment through private agencies, and that it should be made a misdemeanor for any one to collect a fee from persons seeking employment in the service of the state or any political or civil division thereof.

EIGHT HOUR LAW FOR WOMEN.

In this chapter it is not our purpose to present a complete survey of the operation of the eight hour law for women, as we have recently been making a special investigation and our data will not be complete until the end of this year. As soon as our material is in hand we intend to make a special report on this subject.

The eight hour law for women, passed at the legislature of 1911, became effective on May 21, 1911. As is the case in most labor laws no provision was made for its enforcement. This Bureau immediately undertook to put the law into effect and had 6,000 copies of the law printed and distributed. We sought to give this law a wide publicity and notified the employing public that we intended to see that they conformed strictly to the letter of the law. At first a great deal of opposition arose, and all sorts of statements and threats were made by employers to the effect that business would be ruined and that they would have to discharge their female employees. This bureau, however, did not take much stock in these arguments and proceeded to enforce the law.

The greatest opposition came from the hotel proprietors, who declared that the law was unconstitutional, as it discriminated between the employees in a hotel and those in a rooming or boarding house.

A test case was started in Riverside, and on June 10, 1911, the Hon. F. E. Densmore, Judge of the Superior Court of Riverside County, declared the provision of the act relating to hotels unconstitutional, but that the eight hour law in all other respects was constitutional. The defendant was rearrested on June 12, 1911, and the case was taken to the Supreme Court of the State of California on an application for a writ of habeas corpus. On May 27, 1912, the Supreme Court, sitting in Bank, in a unanimous decision declared the eight hour law constitutional. This decision is printed in full in the chapter entitled "Decisions and Opinions." In the same chapter will be found two opinions of the Attorney General relating to the eight hour law. During the fiscal year ending June 30, 1912, 622 complaints were filed in the offices of the Bureau, accusing employers of violating the provisions of the eight hour law. All these complaints were investigated by the officers of the Bureau and where violations were found the employer was given a warning that in the event he was again found violating the law, prosecution would be started against him.

Complaints for Violation of Eight Hour Law for Women Filed in Bureau and Investigated During Fiscal Year ending June 30, 1912.

Tailors	67	46	21
Theaters	9	9	-----------
Miscellaneous	56	40	16
Totals	622	466	156

The largest number of complaints was against hotels, apartments and boarding houses. These amounted to 89 and constituted 14.3 per cent of the total. Then follows the restaurants with 84 complaints or 13.5 per cent of the total; tailors with 67 complaints or 10.8 per cent; dry goods, clothing and department stores with 65 complaints or 10.4 per cent; and laundries with 61 complaints or 9.8 per cent of the total complaints filed.

During the fiscal year ending June 30, 1912, 72 prosecutions were conducted by the Bureau against employers who persisted in working their women over eight hours per day or more than forty-eight hours per week. We succeeded in obtaining 44 convictions, while 17 cases were dismissed and 11 cases were still pending at the close of this fiscal year. The work involved in the prosecution of an employer under the eight hour law is greater than one is at first led to assume. As a rule it is necessary to detail two men to keep a watch on the number of hours the women are working. This is done in order to avoid calling on the women to testify against their employer, as such testimony would cause their discharge and perhaps prevent their obtaining employment at any other place. In other words, they would be black-listed.

The most persistent violators of the eight hour law are the French laundries, and when prosecuted they invariably present the same defense, namely, that the women were ironing their own clothes after they had completed their eight hours of employment.

During the course of our inspection of over 5,000 factories and stores, we requested the number of women that had been discharged on account of the eight hour law; also the number of women that had been added. The replies to these questions were not altogether satisfactory on account of the apathy of some of the employers. Some of the employers stated that they had discharged part of their female employees when we had reason to believe otherwise, while some were not willing to admit that they had discharged any women or that they had been compelled to add some. We submit the following figures merely for what value they may have in showing the effect of the eight hour law upon the women employed in factories and stores.

Effect of the Eight Hour Law on Women employed in Factories and Stores (as reported by employers).

City.	Number of women discharged.	Number of women added.
San Francisco	10	15
Los Angeles	20	162
Oakland	10	31
All other places	21	25
Totals	61	233

A special investigation of hotels was made, which included the principal hotels in San Francisco and Los Angeles and their vicinities. The results of this investigation are given in the following table. and we believe they are a good indication of the effect of the eight hour law upon women employed in hotels.

Reports on 49 hotels in San Francisco and vicinity, employing a total of 726 women, showed that only seven women had been discharged and 75 women had been added as a result of the eight hour law. The wages of 15 women had been reduced in one hotel.

Reports on 34 hotels in Los Angeles and vicinity, employing a total of 680 women, showed that 24 women had been discharged and 76 women added, while 65 women in two hotels had had their wages reduced.

Effect of Eight Hour Law on Women employed in Hotels in San Francisco and vicinity.

OCCUPATIONAL DISEASES.

By act of the legislature of 1911 (Chapter 485, Statutes of 1911), every medical practitioner in the State of California is required to report to the State Board of Health all cases which he attends of persons "whom he believes to be suffering from lead, phosphorus, arsenic or mercury or their compounds, or from anthrax, or from compressed-air illness, contracted as a result of the nature of the patient's employment." The medical practitioners receive 50 cents for each case reported. The State Board of Health is directed to transmit a copy of the practitioner's report to the Bureau of Labor Statistics.

During the fiscal year ending June 30, 1912, only ten cases of occupational diseases were reported, five of which resulted in death. This number is far too small to be of any statistical value. It is undoubtedly true that many physicians have failed to report the cases coming under their observation, but at the same time it is also a fact that there are only a small number of industries in this State, in which the employees are particularly liable to contract these diseases. At the present time there are only two white lead factories in the State.

Record of certificates of occupational disease filed during fiscal year ending June 30, 1912.

IMMIGRATION

With the opening of the Panama Canal a new labor problem will confront us in this State, namely, that of restricting the immigration that will come to our shores. The first step in this direction was taken on August 20, 1912, when an Immigration Commission was appointed by the Governor. The immigration problem is one that particularly affects the conditions of labor and we should be prepared to meet the problem when the Canal is opened. The position of this bureau is best stated in an address by the Commissioner before the conference of State Immigration, Land and Labor Officials, with representatives of the Division of Information, Bureau of Immigration and Naturalization, Department of Commerce and Labor, which was held in Washington, D. C., November 16 and 17, 1911.

The following is a copy of the above mentioned address:

MR. MCLAUGHLIN. *Mr. Chairman and gentlemen:* I am representing in this conference the State of California. The title of the office to which I have been recently appointed is that of Commissioner of the Bureau of Labor Statistics. At the outset, let me state that in California I believe we have a situation different from any I have heard described here to-day. California, until recently, has been a state of large land holdings, due to the fact that when the United States acquired its western possessions it recognized as valid the Spanish land grants. These land grants — of which there are about 600 — contained immense areas. When agriculture succeeded gold mining, some of the owners turned to cultivating these lands, while others held them and are still holding them until such time as they shall be divided up into small farms. This led to two problems that have confronted the people of California for the past thirty or forty years. The former called for a large amount of cheap labor, while the latter prevented the American farmer from the Eastern States and the European immigrant agriculturists from obtaining small acreages at reasonable prices.

The influx of the Chinese, after the Burlingame Treaty, gave the farmers the cheap labor they desired, and I believe it was about the cheapest labor that could be obtained at that time. The cheapness of this labor, the high quality of the products raised and the successful sale of same increased the land values of these farms, and also those land grants that were being held, until the price of both had risen to such a point in many sections of the State that it was practically impossible for the average man to go into the business of farming. Then came the exclusion of the Chinese and the subsequent demand for some other labor to take his place. The Japanese became the successor of the Chinese in farm labor, but let it be understood at this time that the people of the State of California did not desire the Japanese, but were compelled to accept him in lieu of any other.

Probably the most important point in farming in California, and the one I desire to call your particular attention to, is that it is highly specialized. It was early demonstrated that certain crops could be grown to great advantage in certain localities, with the result that practically everybody in that locality went into the raising of that particular crop, thus calling for a large amount of labor during the season when such crop was harvested. This condition accounts for the employment of the Japanese. The Japanese is a migratory laborer, whereas the white man seeks to live where he works. The Japanese who is picking cherries in Vaca Valley (which is in the northern part of the State), say in May, will follow the different seasons and crops until he is picking oranges in the southern part of the State (over 500 miles away) during the months of December and January. The Japanese are under a directorate that simply shifts them from place to place and from crop to crop, with the result that they obtain a maximum amount of employment during the year. Of course there are certain classes of work which are distasteful to the white man and to which the Japanese is adapted, namely those which must be performed in a stooping or squatting position, such as picking berries, cutting asparagus, etc. No alien race has supplanted the white man in our grain fields. Even on land owned and operated by Japanese, the white man handles the horses and does the cultivating, but the balance of the work is done by the Japanese.

In the past year California has come face to face with a new problem — that is, the replacement of the Japanese. Since the adoption of the agreement between the United States and Japan in 1907, the Japanese laborer has to some extent remained away temporarily from our shore and the number of Japanese farm laborers has diminished. We must now look forward to Europe to obtain our supply of farm labor. We have already started to solve this question by the employment of Greeks. Thousands of Greeks have come to California in recent years to be employed in railroad construction work, but owing to lack of this class of work during the past year and dissatisfaction of condtions under which they were laboring they were induced to take up agricultural work, principally grape picking. In the early part of this year a shortage of help was reported in the Fresno grape district. In many instances Japanese contractors announced that they could not fulfill their contracts for the picking of grapes, owing to their failure to obtain a sufficient number of their own countrymen. Through the efforts of a society into which the Greeks have been recently organized, and who have established a free employment agency in the city of Fresno, about 2,000 Greek laborers were brought into the Fresno district and picked a large part of the crop. Even some of the Japanese employed these Greeks. From reports received so far the Greeks have proven satisfactory and have been a positive influence in driving the Japanese out of this district. The shortage of help for the harvest has been universal throughout the State. Just before my leaving, I called upon an agency in Sacramento, representing the same Greek organization, and requested them to send 200 to 300 men into Butte County for the purpose of picking oranges, as I had heard of a shortage of labor in that vicinity.

An important point regarding white farm labor in California is that they are not shown the respect that, in my estimation, is due them. This is accounted for largely by the fact that the short period of time they work on any one farm does not seem to justify the owner in providing accommodations for them, with the result that they are required to carry their blankets on their backs and use the sky for a roof. This condition is not conducive to the development of a good class of farm labor, but rather to a class of "hobos." For six months of the year they have the sheriff chasing them out of town for refusing to work and the other six months they get chased out of town for asking for work. Personally, I sympathize with the man who is migrating from place to place, sometimes looking for work and at other times trying to dodge the tax collector or the sheriff. Perhaps I cannot help that, owing to the fact that my life has been spent in close contact with the man who toils.

The opening of the Panama-Pacific canal will probably solve the farm labor problem in California, but at the same time will place us on guard against the possible influx of undesirable immigrants from southern Europe, Asia Minor, and Africa. For an additional cost of from $7.50 to $10.00, the immigrants that are now pouring into New York will be landed in San Francisco. California wants immigrants to cultivate its soil, but it wants the good, sturdy peasants of Europe, not the people from seaport towns who bring with them all their vices and no virtues and who congregate in our large cities and form colonies, in which they maintain their own habits and customs and are a continual source of annoyance to our police departments. But I realize that in order to obtain the class of immigrants I describe it will be necessary for us to look after their interests upon their landing on our shores. We have no Bureau of Immigration in California. At the last session of the legislature a bill was introduced providing for a free employment bureau, but owing to the fact that it did not carry with it an appropriation, the Governor did not see fit to sign it. However, we have hopes that it will be provided for by the next legislature, and I know the Governor is inclined to favor it as an experiment. A free employment bureau would be of invaluable assistance in securing work upon the farms of our State for the incoming immigrants. An effort should be made, however, to have the immigrants arrive during the months of the harvest — say from May to August. It would then be a comparatively easy task to secure employment for them in the agricultural and horticultural districts. The immigrants once placed in the fields, the question would solve itself. The industrious immigrant could acquire a small farm in a few years under the proper schemes of colonization, which are now under way, dividing up the large land holdings of our State. These people in turn would develop an agricultural community, which in time would solve the farm labor problem, with the adoption of a scheme of varied crops within certain localities and the gradual doing away with high specialization. But if the immigrants arrive after the harvest they will associate with their own countrymen in the large cities, with the result that after being there for six or eight months it will be practically impossible to place them upon the farms. Once given a taste of city life, they would never turn to agricultural pursuits. I believe this is the experience of all the large eastern ports of entry.

My Bureau, I am satisfied, is willing in every way possible to give you all the information that can be had and to lend any and every assistance possible to this Division. I believe myself — though along lines suggested by my friend, Mr. Nugent — that without the Government or State lending first aid to these people as they arrive — something to sustain them at least for the first year to get them established — it will be almost useless to send them out for a month or two, where they meet the conditions that I have related, and then let them go back into the city and throw them on the hands of the municipality.

At this time of the year they come from all over the State of California into the city of San Francisco. We have a large county hospital and an almshouse there, and the inhabitants of these institutions jump 700 or 800 as soon as the winter months come on. Possibly San Francisco is better situated in that respect than some other cities, but such is the case, and they all come that way.

I might add, further, that I am one who believes in restricting immigrants to a certain extent. Mr. Gompers, in his report at the last convention of the American Federation of Labor, had this to say regarding immigration:

> "The sixty-first Congress during the short session refused to take up for consideration the immigration bill, requiring an educational test for immigrants, by Mr. Gardner of Massachusetts, which had been placed on the discharge committee calendar in the previous session, and it refused to take up for consideration the bill of Mr. Hayes of California, introduced by him for the purpose of obtaining legislation excluding Asiatic immigrants.
>
> "The Commission appointed by the fifty-ninth Congress, February 29, 1907, to inquire into the general subject-matter of immigration, made its final report to Congress December 5, 1910. The Commission recommended several methods of restricting immigrants, among which were:
>
> (1) 'The exclusion of those unable to read or write in some language.
>
> (2) 'The reduction of the number of each race arriving each year to a certain percentage of the average of that race arriving during a given period of years.
>
> (3) 'The exclusion of unskilled laborers unaccompanied by wives or families.
>
> (4) 'The limitation of the number of immigrants arriving annually at any port.
>
> (5) 'Material increase in the amount of money required to be in the possession of the immigrant at the port of arrival.
>
> (6) 'Material increase of the head tax.
>
> (7) 'The levying of the head tax so as to make a marked discrimination in favor of men with families.'"

Now, any of these points I believe would be drawing a line that could properly be exercised, because as it stands at present a great many of the larger corporations are bringing immigrants into this country and treating them as nothing more than common slaves. Those of us who have been around know that condition, and God forbid that it be allowed to continue, because I can foresee to what it is going to lead.

In speaking of migratory laborers, President Gompers has this to say, and there is a good deal of truth in it, as I think you will agree:

> "Resolutions 44 and 86 of the St. Louis Convention, relating to migratory laborers, was referred by it to the Executive Council. By reason of my then contemplated visit to the Pacific Coast States, the Executive Council referred the subject-matter to me for investigation. I have seen and spoken with some of the migratory laborers and their spokesmen, and held prolonged conferences with the representative labor men of the Pacific Coast who have given this subject of migratory and casual labor their closest observation, and the following is the result of my investigations, with the recommendations I submit for your consideration and action.
>
> "The lot of the migratory laborer in the United States to-day is in some points worse than slavery. The slave was at least sufficiently well nourished to enable him to perform his allotted tasks. He was assured of a shelter in case of illness; of as much care as a thrifty farmer will give to his horse or

> other domestic animals. But the very large proportion of unskilled or casual workers who at the present time usually find employment only on short jobs or at season work suffer a precarious existence. As they move from place to place, they often go hungry, and while at work their food is usually of a poor quality, ill prepared. Many of them do not earn enough to establish a home or to pay for medical attendance when sick or suffering from accidents. The character of much of the work performed in the United States does not permit of the steady employment of a regular body of men. Railroad extension work, the construction of bridges and highways, much work in lumbering, waterway, canal, and drainage, and in the building trades, which are mostly carried on in the less inclement seasons of the year, are characterized by idleness for months together of tens of thousands of men. In agriculture, large bodies of men are employed during the seasons of ploughing, seeding, planting, and harvest, only to be left without steady work the rest of the year. In all, it is difficult to estimate how many men are thus living in the United States to-day, but the number reaches into the millions."

He goes on to explain what the Pacific coast has to fear with the opening of the canal, and I thoroughly agree with him.

I desire to thank this Bureau for the call, and hope to be able to render you any and every assistance when called upon. [Applause.]

THE CHAIRMAN. Have you in your brief period of activity in your Bureau had any knowledge of the Swiss and Italian colonies that are out there?

MR. MCLAUGHLIN. The Italian in California is very thrifty, more so, I dare say, than in any other state in the United States. With the Italian we have had little or no trouble. There are some of them on railroad work, but many of them have taken to farming, particularly in the grape and wine business, and we have no cause to complain in any manner of the Italian.

The Swiss has largely taken to dairying, and we have never had any trouble whatever with them. They have colonies in some sections of the State. The Swiss is entirely in the dairy business; the Italian is largely in the fruit, vegetable and produce business.

MR. TRENOR. Mr. Chairman, I should like to make an observation with reference to the passage just read from Mr. Gompers' report, in which he says that the Immigration Commission recommended the various measures of restriction. I think a perusal of the report will show that they did not recommend them, but pointed them out as a means by which restriction could be had, without specifically recommending those things.

MR. MCLAUGHLIN. I read from his report.

MR. TRENOR. I understand, but I think he is mistaken in that, although afterwards it was formulated into a bill.

THE ALASKA SALMON CANNERIES.

The queston of the payment of wages to the men employed in the Alaska salmon canneries has been one of great annoyance to the Bureau during the past two seasons. These men are hired in San Francisco during the months of March and April and are shipped north to work in the salmon canneries, located on the coast of Alaska. They are returned during the months of August and September and are paid off in San Francisco for the full season's work. At the time these men are paid off the real trouble begins. Innumerable disputes arise on account of the deductions that are made for various items—principally for gambling debts, liquor and food. In order to fully realize the situation, it will be necessary to explain the methods resorted to in the hiring of men to work in these canneries. As a rule, the company owning or operating the cannery enters into a contract with a Chinese contractor, whereby the Chinese contractor agrees to furnish all the help necessary to clean, pack, cook, label and box all the salmon delivered to him at a certain cannery. The company agrees to pay the Chinese contractor a certain amount for each case of salmon packed and guarantees a minimum number of cases. If no salmon is packed—by reason of the failure to deliver the fish at the cannery, which may arise when the salmon are not running—the Chinese contractor receives his contract price. The Chinese contractor guarantees to deliver a certain number of men—necessary to operate the cannery—and is penalized in the sum of $250 for each man he is short on the day of the sailing of the company's ships As soon as the Chinese contractor signs up with the company, he sublets his contract to several other sub-contractors, consisting chiefly of Japanese, Filipinos, Porto Ricans and Mexicans. These sub-contractors go among their own people and hire them for the season at a fixed sum, usually from $160 to $180. This sum is, as a rule, the full amount that the Chinese contractor has allowed the sub-contractor, but the sub-contractor figures to make his money from the privileges of running the "slop chest"—which is the term applied to the store—and from the gambling. In addition the sub-contractor draws his wages, and it is the general practice for a sub-contractor to work along with his men at the cannery. The Chinese contractor advances $40 for each man to the sub-contractor. The sub-contractor turns this amount over to his men, but not directly. Usually he permits them to go to some store which he selects—where they can purchase clothes—and he often pays their room and board up to the time of sailing, for it must be understood that the hiring of men goes on for months before the ship sails. When the men are on board the ship, whatever is left of the $40 advance money, after the above deductions have been made, is paid to them. A rather interesting deduction is the one of $2.50 to $5.00 per man for services of detectives and watchmen, who are employed by the sub-contractor to see that the men do not get away before the ship sails. Here we have the unique position of a man being obliged to pay for the privilege of being watched so that he cannot run away. The Chinese contractor furnishes the food on the voyage to and from and during the time the men are at the cannery. This food consists of the regular Chinese fare, namely, rice, kelp, tea, and sometimes beans, except that at the cannery, fish is often given to the men. The food question causes considerable trouble, owing to the fact that the men do not relish it and are compelled to buy American foods from the ''slop chest'' or from the Chinese stores. On the return to San Francisco, the company pays the Chinese contractor the total amount due him under the terms of the contract, and the Chinese contractor in turn pays to the men the amount agreed upon, less the charges that appear against them in an account rendered by the sub-contractor. In past years, the Chinese contractor would turn the money over to the sub-contractors for payment to the men, but it became a general practice for the sub-contractors to abscond with the money, and leave the men clamoring at the doors of the Chinese contractor for their wages.

During the past few years the offices of this Bureau have been besieged by hundreds of these cannery hands upon their return from Alaska. These men present a multitude of claims, which involve questions of false or exorbitant deductions on their wages. Many of these men are returned to San Francisco without a cent due them after a season's work, all of it having been charged against them for food or gambling debts, incurred at the gambling tables operated on the ships by the sub-contractors. While the Bureau has been successful in getting redress in many cases, still our laws at present are inadequate to cover the situation. And it is important to note that the situation is a grave one, for it must be borne in mind that, when you cast several thousand irresponsible men who are penniless—or almost penniless—adrift in this city, after they have toiled for five or six months—you add a large factor to the criminal element of the community.

The following are the totals copied from a pay roll and gives a good idea of the causes that lead to the trouble in the settlement of the wages of the cannery hands in Alaska.

Analysis of a Sub-Contractor's Payroll.

Total number of men hired	138	
Total amount of wages		$22,495 00
Less: Advance of $40 per man	$5,520 00	
Advance for gambling	6,611 80	
Slop chest (food, etc.)	4,859 35	
Chinese store	731 50	
Total deducations		$17,722 65
Balance of wages due at end of season		$4,772 35
Average wages per man		$163 00
Average deduction per man		128 42
Average payment per man in San Francisco		$34 58

The following table shows the number of cannery hands and fishermen shipped from San Francisco during the season of 1912. What has been said in this chapter does not apply in any degree to the fishermen. The latter have a strong organization and are paid off under the supervision of the United States Shipping Commissioner. It applies only to cannery hands which consist chiefly of Chinese, Japanese, Filipinos, Porto Ricans, Mexicans, Spanish, Negroes and a sprinkling of many other races.

MEN SHIPPED FROM SAN FRANCISCO TO ALASKA SALMON FISHERIES, SEASON OF 1912.

Cannery hands	4,954
Fishermen	1,965
Total	6,919

There is also submitted a table showing the exorbitant prices charged for food, etc., for it will be remembered that the men are only furnished with Chinese grub and crave these American foods and luxuries, which they are compelled to buy from the "slop chest" conducted by the subcontractors.

COMPARATIVE PRICES OF VARIOUS COMMODITIES.

Commodity.	Price charged by sub-contractor.	Price in San Francisco.
Apricots, canned, per can	35 cents	15 cents
Beef, canned, per can	35 cents	15 cents
Beef, corned, per can	35 cents	15 cents
Beer, per bottle	50 cents	10 cents
Chocolate, per can	75 cents	35 cents
Cigars, each	10 cents	2½ cents
Clams, per can	25 cents	10 cents
Crabs, per can	35 cents	15 cents
Crackers, per box	30 cents	10 cents
Gum, chewing, per package	10 cents	5 cents
Jellies, per jar	25 cents	10 cents
Marmalade, per jar	30 cents	15 cents
Milk, condensed, per can	25 cents	10 cents
Peaches, canned, per can	35 cents	15 cents
Raisins, per package	35 cents	15 cents
Sardines, small, per can	15 cents	5 cents
Sardines, large, per can	50 cents	20 cents
Sausages, small, per can	25 cents	10 cents
Sausages, large, per can	35 cents	15 cents
Soda water, per bottle	15 cents	5 cents
Sugar, per package	25 cents	10 cents
Tobacco, chewing, per plug	10 cents	5 cents
Tobacco, smoking, per package	15 cents	5 cents
Tomatoes, canned, per can	35 cents	10 cents
Pineapple, canned, per can	35 cents	15 cents

During a recent investigation, we had occasion to take the testimony of several men who had been employed in the Alaska salmon canneries, and the following will give a fair idea of the conditions prevailing in this industry:

SWORN TESTIMONY OF PEDRO BARBOSA, ON LABOR CONDITIONS IN THE ALASKA SALMON FISHERIES.

Q. What is your name?
A. Pedro Barbosa.
Q. Where were you born?
A. Porto Rico.

Q. Who hired you to go to Alaska?

A. Marscelina Martinez.

Q. How much did he agree to pay you for the season's work?

A. $160.00.

Q. How much advance money did he give you?

A. $35.

Q. How much advance money did he charge you with?

A. $40.

Q. Why was there a difference of $5.00.

A. The $5.00 was commission.

Q. On what ship did you sail?

A. On the St. Katherine.

Q. On board the ship, who fed you?

A. The Japanese.

Q. What did they give you to eat?

A. Rice and some kind of stuff like seaweed—kelp—and tea.

Q. Did you get enough water to drink?

A. Just got water to wash my face. Asked the Japanese for water but did not get any to drink.

Q. When you got to Alaska, who did the cooking?

A. Japanese.

Q. What kind of food did you get there?

A. The same kind. Only they had fish, cooked in "soya" and I could not eat it.

Q. How many hours did you have to work in the cannery?

A. Get up at three o'clock in the morning and work till 6 and 7 at night.

Q. What kind of work did you do?

A. Washing cans in lye.

Q. Did you lose any time through sickness?

A. No, sir.

Q. What did they pay Indians?

A. I heard they pay $3.50 a day. They don't pay him money, but give him grub in the American store, and the company charges the Jap $3.50 a day for grub.

Q. Did they sell any whisky or liquor on the ship.

A. Yes, sir. Marscelina and the Japanese both sold liquor.

Q. Did they sell whisky at the cannery?

A. Yes. Marscelina and the Jap did.

Q. What did they charge you for whisky?

A. A soda water bottle full cost $1.00 from Marcelina, and 75¢ from the Japanese.

Q. Was there gambling on board ship?

A. You "betcher life."

Q. What games were they running?

A. Monte and poker.

Q. Was you playing?

A. Yes, I played myself. I ran the game. I paid Marscelina $200.00 for the privilege of running the game.

Q. How much did the boys lose in the game?

A. Some boys lost as high as $50.00 and $60.00.

Q. How were these losses charged up?

A. Played for tickets.

Q. Who furnished the tickets.

A. Marscelina.

Q. Where were these tickets payable?

A. Mascelina cashed the tickets in San Francisco.

Q. How did the men pay for the tickets?

A. They were charged against their wages.

Q. How much did Marscelina make on the gambling?

A. He made $200.00.

Q. Did the Japanese run a gambling game too?

A. Yes, they kept a different gambling table.

Q. Did the Porto Ricans play at the Japanese table?

A. No, the Japanese came over and played at the Porto Rican table.

Q. When you came back to San Francisco, how much money did you have coming to you?

A. $193.90.

Q. How is this amount so large?
A. I made up the difference in gambling.
Q. How much did you spend for groceries, etc?
A. About $35.00.
Q. How long have you been in the United States?
A. Since 1901.
Q. Are you a citizen of the United States?
A. Yes, sir.
Q. How many trips have you made to Alaska?
A. I made four trips; three for Marscelina and one for the Alaska Packers.
Q. Do you reside in San Francisco?
A. Yes, sir.
Q. What is your address?
A. 1316 Kearny street.
Q. That is your own place?
A. Yes, sir.
Q. Do you reside there with your family?
A. Yes, sir.
Q. At what cannery did you work?
A. The Ugashik, owned by Frank B. Peterson.
Q. Do you know whether Marscelina had to pay the Japanese for the privilege of gambling?
A. I don't know.

SWORN TESTIMONY OF ENRICO BONAPARTE ON LABOR CONDITIONS IN THE ALASKA FISHERIES.

Q. What is your name?
A. Enrico Bonaparte.
Q. Where were you born.
A. Porto Rico.
Q. Are you a citizen of the United States?
A. Yes, sir.
Q. Who hired you to go to Alaska?
A. Marscelina Martinez.
Q. What did he hire you as?
A. I was hired as bookkeeper; also to work washing cans in lye.
Q. What compensation were you to receive?
A. Was to receive $160.00 for the season, and 25 per cent of all the receipts from the sale of food and liquor, and from gambling.
Q. On what ship did you sail?
A. St. Katherine.
Q. When did it sail from San Francisco?
A. On April 20, 1912.
Q. Were you to get the same food as the other men?
A. Just the same.
Q. What food did you get?
A. Rice, tea, same as other men.
Q. Was there any gambling on the ship?
A. Yes.
Q. Who ran the gambling table?
A. Pedro Barbosa.
Q. Did you do any gambling yourself?
A. Yes, sir.
Q. Did you lose any money?
A. I won about $50.00.
Q. What did you gamble with?
A. First with money, and afterwards with the tickets I had won.
Q. What game did you play?
A. Monte.
Q. Who was dealing?
A. Sometimes I dealt, sometimes Barbosa and sometimes Martinez.
Q. Did you keep the books showing the number of tickets?
A. No, Martinez marked the books for the gambling tickets and I marked for the food and liquor.

Q. Did you sell whisky and liquor up there?

A. Yes, sir.

Q. How much did you charge for it on the ship?

A. $1.50 for a big bottle on the ship; up at the cannery $1.00 for a small soda water bottle full.

Q. Did you do any gambling at the cannery?

A. No.

Q. Do you know how many, or how much worth of gambling checks Martinez had?

A. Between $400.00 and $500.00 worth.

Q. How much did Martinez charge Barbosa for the gambling table?

A. $200.00.

Q. How much did you have coming to you when you came back to San Francisco?

A. $183.85 for wages and gambling.

Q. How much did you have to pay for food?

A. I got most of my food by giving the Americans liquor.

Q. Could you eat the Japanese food?

A. No.

Q. At what cannery did you work?

A. Ugashik.

Q. Who runs this cannery?

A. Frank B. Peterson & Co.

Q. What were the names of the Japanese contractors?

A. Kaipou and Sakamake.

Q. Where is their place of business?

A. They keep their general merchandise store in San Francisco. I do not know the address.

Q. Where do you live?

A. 1316 Kearny street.

Q. Is your home in San Francisco?

A. Yes, I live here all the time.

Q. Has Marscelina settled up with you for your 25 per cent yet?

A. Not yet.

Q. About how much is coming to you on commission?

A. 25 per cent of $200.00 for gambling, and 25 per cent of $608.00, profit from the store for the sale of food and liquor.

Q. How many trips have you made to Alaska?

A. Nine trips. Seven times with Marscelina and twice for the Alaska Packers' Association.

Q. Are the conditions any worse now than they were before?

A. Conditions the same.

SWORN TESTIMONY OF RICHARD FELICIANO ON LABOR CONDITIONS IN THE ALASKA SALMON FISHERIES.

Q. What is your name?

A. Richard Feliciano.

Q. Where were you born?

A. Porto Rico.

Q. Who employed you to go to Alaska?

A. Marscelina Martinez.

Q. Where did he hire you?

A. In San Francisco.

Q. At the time he hired you, what did he agree to pay you?

A. $160.00 for the season.

Q. How much advance money did he give you?

A. $35.00.

Q. How much advance money did he charge you up with?

A. $40.00.

Q. Why this difference of $5.00? Did he take off $5.00 for getting you your job?

A. I guess so. Yes.

Q. Did you receive the $35.00 advance money in actual cash?

A. Yes, $35.00 in cash. He paid me in my hand, and afterwards I paid the storekeeper.

Q. When did you get the $35.00, while on shore?
A. On board ship.
Q. Where did you buy your supplies, on board ship or on land.
A. On shore.
Q. How is it it you paid on board ship?
A. The storekeeper came on board and I paid him for the goods.
Q. Who fed you on the ship?
A. The Japanese.
Q. What did they give you to eat?
A. Rice, kelp and tea.
Q. Did you get the same food every day?
A. Every day; sometimes beans—about two days on the trip.
Q. Did you have anything else to eat.
A. Yes, I had to buy it myself.
Q. Did they give you enough water to drink?
A. No.
Q. How much water a day?
A. One glass for a man a day. Some days none.
Q. Some days you could get none at all?
A. Some days no water.
Q. Did you make any complaint about the water?
A. No.
Q. Did any of the boys complain?
A. Some asked for water. Sometimes they got more and sometimes no water.
Q. What did you have to drink?
A. I went to the white kitchen.
Q. What did the others do, buy some?
A. No, you could not buy water on board.
Q. When you got to Alaska, what cannery did you go to?
A. Ugashik Cannery.
Q.. Who owns this cannery?
A. Frank Peterson is the general agent.
Q. Does this cannery belong to the Alaska Packers?
A. No. To the Red Salmon Canning Company.
Q. When you got to Alaska, where did they house you—where did you sleep?
A. In bunk houses.
Q. Who supplied the food while you were in Alaska?
A. Japanese.
Q. What did they give you to eat in Alaska?
A. Same thing, but some days got fried salmon. When we worked hard, sometimes we got salmon twice a day or three times.
Q. Did they sell any liquor or whisky aboard ship?
A. I don't know; I didn't buy any.
Q. Did they sell any whisky or liquor up at the cannery?
A. I didn't see any sold.
Q. What were the hours of work?
A. Well, sometimes we worked 15 hours; sometimes 10, 12, 13, 14. Some days three or four hours. If the fish were running heavy, we had to work hard.
Q. Were you sick while in Alaska?
A. No.
Q. Do you know how much the Indians got up there?
A. No, I do not know.
Q. Did you hear or ask any Indian?
A. No.
Q. Do the Indians get better food than the men sent from San Francisco?
A. Oh, sure, the Indians get better food.
Q. Do they get regular white man's food?
A. Some of them got the same thing.
Q. How much money did you have when you landed in San Francisco?
A. $65.00.
Q. What did all the rest of your money go for?
A. I owed some of this money to somebody else.
Q. Did you gamble?
A. No.
Q. Was gambling on board?
A. Yes, but I don't gamble.

Q. Why did you come back with only $65.00?

A. Most of the difference went for to buy food.

Q. Was there gambling on board the ship?

A. I saw some gambling but I don't know if it was for money, they played with poker chips.

Q. Did you see them use any tickets?

A. I am not sure, but there was gambling on board.

Q. What was the name of the ship you sailed on?

A. Saint Katherine.

Q. What day did you leave San Francisco?

A. April 20, 1912.

Q. When did you land in San Francisco?

A. September 8, 1912.

SWORN TESTIMONY OF PETER HUNTER ON LABOR CONDITIONS IN THE ALASKA SALMON FISHERIES.

Q. What is your name?

A. Peter Hunter.

Q. Where were you born?

A. Charlotte, N. C.

Q. By whom were you hired?

A. Lino took me to the Chinaman, Quong Ham Wah, who hired me.

Q. Was Lino your boss?

A. Yes, sir.

Q. Why did he take you to the Chinaman?

A. He said he had all the men he wanted, but would take me up with the Chinese gang.

Q. What did he agree to pay you for the season's work?

A. Said $160.00 for general work, and if I did extra work would get $20.00 more.

Q. On what ship did you sail?

A. The Standard.

Q. How much advance money did you get?

A. $40.00.

A. Was the $40.00 paid in cash?

A. No, sir, only $19.75.

Q. By whom was it paid you?

A. It was paid by Snyder.

Q. Why was there a difference—that is the $40.00 advance money and the amount paid you, namely, $19.75?

A. The difference for supplies and board at Snyder's.

Q. Who fed you on the boat?

A. The Chinese contractor.

Q. What food did he supply you with?

A. Rice, seaweed and tea.

Q. Same fare every day?

A. Yes, sir.

Q. Did you receive any drinking water?

A. No, sir.

Q. Did you ask for any?

A. Yes, sir, every day.

Q. What did they say?

A. Said they did not have enough, and were afraid that it was going to run out.

Q. Who fed you at the canneries?

A. The same Chinese.

Q. What food did you get at the canneries?

A. Same food, except fish, during the fishing season.

Q. What were the hours that you worked at the cannery?

A. 4 a. m. to 9 p. m. during the season.

Q. How long was the season?

A. About two months.

Q. Was there any liquor sold on board the ship?

A. Yes, sir.

Q. Who sold it?

A. Lino and the Chinaman.

Q. Did you buy any?
A. Yes, sir.
Q. What did you have to pay for it?
A. $1.50 a bottle.
Q. Was it regular size bottle?
A. Yes, sir.
Q. Was any liquor sold at the cannery?
A. Yes, sir.
Q. Who sold it there.
A. Lino and the Chinaman.
Q. Did you buy any there?
A. Yes, sir.
Q. How much did you pay for it?
A. $2.75 a bottle.
Q. Was there any gambling on board the ship?
A. Yes, sir.
Q. Who ran the gambling game?
A. A Mexican, for Lino.
Q. What was the Mexican's name?
A. I think his name was Diaz.
Q. Did you gamble?
A. Yes, sir.
Q. What did you play?
A. Black Jack.
Q. How much money did you lose?
A. $50.00.
Q. What did you gamble with?
A. I gambled with checks.
Q. Where did you get the checks?
A. From Lino.
Q. How did you get them?
A. Took them out of my wages.
Q. Did you lose any time through sickness?
A. No, sir.
Q. How much money did you receive on your return to San Francisco?
A. He offered me $4.50.
Q. Why this difference in this amount and $160.00?
A. The balance went for gambling, food and liquor.
Q. How much did you spend for food?
A. About $27.00.
Q. Where do you live?
A. At the Dixie Hotel, Pacific street, between Grant avenue and Stockton street, San Francisco.
Q. Is San Francisco your regular home?
A. No, Fresno.
Q. Have you folks down there?
A. Yes, sir, they live on M street.

SWORN TESTIMONY OF EDWARD SANDERLIN ON LABOR CONDITIONS IN THE ALASKA SALMON FISHERIES.

Q. What is your name?
A. Edward Sanderlin.
Q. Where were you born?
A. Denver, Colorado.
Q. Who hired you to go to the Alaska fisheries?
A. Lino Quisada.
Q. Where is he located?
A. I don't know where he is now.
Q. Where was he at that time?
A. He was living at 1257 Montgomery street.
Q. What did he agree to pay you for the season's work?
A. $160.00 for general work.
Q. Did he have a contract?
A. Yes, sir, from Quong Ham Wah.

Q. How much advance money did he give?

A. $40.00.

Q. Did he give it to you in cash?

A. No. He allowed us to buy clothing, etc., at Snyder's store, Pacific and Grant avenue, and the balance they gave to us on the ship.

Q. Who gave it to you?

A. Snyder.

Q. Was there any money held out for commission for getting you the job?

A. No.

Q. On what ship did you sail from San Francisco?

A. On the Standard.

Q. On what day?

A. 13th day of April, 1912.

Q. In what cannery did you work?

A. Haller Cannery at Ecock.

Q. Who fed you on board the ship?

A. Chinamen.

Q. What food did they give you?

A. Rice, kelp, and tea.

Q. Were you supplied with drinking water?

A. Not a bit.

Q. Did you ask for water?

A. Asked for water every day.

Q. What was said?

A. Said they were figuring on the water running short.

Q. When did you arrive at the canneries?

A. On the 24th day of May, 1912.

Q. Who furnished the food at the canneries?

A. The Chinese contractor.

Q. What food did they give you in Alaska?

A. They gave us rice, same food, with the exception of fish during the season.

Q. You were taken sick on your way up to Alaska, were you not?

A. Yes, sir.

Q. Were you in good health when you left San Francisco?

A. Yes, sir, was passed by physician.

Q. When did you first take sick?

A. After about one week out. First I was taken seasick, then typhoid fever, after about two weeks out.

Q. As soon as you arrived in Alaska, did they put you in a hospital?

A. No, sir.

Q. When did they put you in the hospital?

A. On the second day of June.

Q. Where were in the interim?

A. At the cannery—in bed.

Q. Was a physician aboard the "Standard?"

A. Yes, sir, but he was not a licensed doctor.

Q. Did he diagnose your case as typhoid fever?

A. He did not know what it was, he said he would have to go to a doctor.

Q. How is it they finally came to put you in a hospital?

A. Through the physician saying that I was pretty sick.

Q. Where did they put you in the hospital?

A. At Nulik.

Q. To whom does this hospital belong?

A. I understood it was a government hospital.

Q. Who was the doctor in charge?

A. Dr. French.

Q. When were you discharged from the hospital?

A. June 28, 1912.

Q. When did you go to work again?

A. On the 29th day of June.

Q. Did you work through until the end of the season?

A. No, I was off about five days altogether during the balance of the season.

Q. Were you sick during those five days?

A. Yes, sir.

Q. When did the season close?

A. I think it was the 10th or 11th of August.

Q. Was any liquor sold on board the ship?

A. Yes, sir, whisky and beer.

Q. Who sold it?

A. The Chinaman and Lino, both.

Q. What did they charge for it?

A. Going up on the boat it was $1.75 for a quart bottle.

Q. Did you buy any?

A. I bought one bottle.

Q. Was any liquor sold at the canneries?

A. Yes, sir.

Q. Who sold it there?

A. Same people.

Q. What did they charge for it there?

A. $2.75 a bottle.

Q. Was there any gambling aboard the ship?

A. Yes, sir.

Q. Who ran the gambling game?

A. A Mexican under Lino.

Q. Did you play at all?

A. Yes, sir.

Q. What did they play?

A. Black jack, poker, piute and coon-can.

Q. How much money did you lose?

A. I lost about $25.00 altogether.

Q. Did many of the men gamble?

A. Yes, the largest part of them.

Q. What did they gamble with?

A. With money and with checks.

Q. Where did you get the checks?

A. From Lino.

Q. How did you get them?

A. Whenever we got broke he would issue us checks and charge against our wages.

Q. When you came back to San Francisco, how much money did you have coming to you?

A. My book showed a credit of $67.50, but they presented a hospital bill of $87.50.

Q. This left you indebted to them for $19.20, after a whole season's work?

A. Yes, sir.

Q. About how much money did you have to spend for food?

A. About $48.00.

Q. Where do you live?

A. At the Dixie Hotel, Pacific street, between Grant avenue and Stockton.

DECISIONS AND OPINIONS.

On May 27, 1912, the Supreme Court of the State of California handed down a unanimous decision, upholding the constitutionality of the eight hour law for women. This decision stands out as one of the most progressive decisions rendered in the United States in the matter of labor laws. The decision is printed in its entirety in this chapter.

In the enforcement of the labor laws, this Bureau has often had to call upon the Attorney General for opinions as to the application of certain laws to some particular or peculiar phase encountered. These opinions have been of considerable assistance to the Bureau and really form an important addition to the labor legislation of this State. As a matter of fact, they should be considered as a supplement to our labor laws and we have, therefore, decided to publish them.

The opinions of the Attorney General contained in this chapter, cover the following general subjects:

Opinion No. 2113—Respecting the application of the eight hour law for women to offices; to the handling of perishable goods—other than fruits and vegetables; and to persons working in canneries at work other than that of canning.

Opinion No. 2262—Respecting the application of the labor laws relating to public work, when such public work is done under the provisions of the Vrooman Act.

Opinion No. 2298—Respecting the application of the child labor law to non-resident children employed in walking and talking parts in theatrical performances.

NOTE.—The brief of Ligon Johnson follows this opinion.

Opinion No. 2350—Respecting the application of the eight hour law for women, to women who are stockholders or officers in corporations in which they are employed.

Opinion No. 2383—Respecting the application of the weekly day of rest law to the employees of the city and county of San Francisco.

DECISION OF SUPREME COURT, STATE OF CALIFORNIA, UPHOLDING CONSTITUTIONALITY OF EIGHT HOUR LAW FOR WOMEN.

Crim. No. 1686. In Bank. May 27, 1912.

In the Matter of the Application of F. A. MILLER for a Writ of Habeas Corpus.

Application for writ of *habeas corpus* prayed to be directed against F. P. Wilson, sheriff of the county of Riverside.

For Petitioner—Flint, Gray & Barker and Gray, Barker, Bowen, Allen, Van Dyke & Jutten.

For Respondent—Lyman Evans, District Attorney; Purrington & Adair; William Denman, *amicus curiæ;* G. S. Arnold, of counsel; Thos. F. Griffin and Leon Yanckwich, as *amici curiæ.*

The petitioner applies for release from custody on a charge of violating the provisions of the act of March 22, 1911, forbidding the employment of women in certain establishments for more than eight hours in one day, or more than forty-eight hours in one week. (Stats. 1911, 437.) The specific charge is that on June 12, 1911, he employed and thereupon required Emma Hunt, a female, to work during that day for nine hours in the Glenwood Hotel, as an employee therein. His contention is that the act is unconstitutional and void.

Three grounds are urged in support of this claim: 1. That the restrictions imposed by the statute upon the freedom of contract are in violation of section 1, article I, and section 18 of article XX, of the constitution, and that it is consequently invalid; 2. That the act is special, that it is not uniform in its operation, and that it makes arbitrary discriminations between persons and classes of persons similarly situated contrary to the limitations of sections 11 and 21, article I, and section 25 of article IV of the constitution; 3. That it embraces two distinct subjects, contrary to section 24, article IV of the constitution.

The material parts of the statute are as follows:

"Section 1. No female shall be employed in any manufacturing, mechanical or mercantile establishment, laundry, hotel, or restaurant, or telegraph or telephone establishment or office, or by any express or transportation company in this state more than eight hours during any one day or more than forty-eight hours in one week. The hours of work may be so arranged as to permit the employment of females at any time so that they shall not work more than eight hours during the twenty-four hours of one day, or forty-eight hours during any one week; *provided, however*, that the provisions of this section in relation to the hours of employment shall not apply to nor affect the harvesting, curing, canning or drying of any variety of perishable fruit or vegetable.

"Section 2. Every employer in any manufacturing, mechanical or mercantile establishment, laundry, hotel or restaurant, or other establishment employing any female, shall provide suitable seats for all female employees, and shall permit them to use such seats when they are not engaged in the active duties of their employment."

Section 3 declares it a misdemeanor, punishable by fine or imprisonment, or both, for any employer to require any female to work in any of the places mentioned in section 1 more than the number of hours allowed by the act, during any one day of twenty-four hours.

1. Section 18 of article XX of the Constitution provides that "no person shall, on account of sex, be disqualified from entering upon or pursuing any lawful business, vocation or profession." This section prohibits any discrimination of this kind based solely on distinctions of sex. But, as in case of the other constitutional guaranties, this provision is subject to such reasonable regulations as may be imposed in the exercise of police powers. It does not forbid such reasonable restrictions upon the hours of labor of women as may be necessary for the protection and preservation of the public health. (*Ex parte Hayes*, 98 Cal. 556; *Foster* vs. *Commissioners*, 102 Cal. 490.)

2. Recognizing the importance of personal liberty, our state constitution at the outset declares that all persons have an inalienable right to enjoy life and liberty and to acquire and possess property. (Art. I, sec. 1.) This, necessarily, includes liberty to work for the purpose of acquiring property, or to accomplish any desired lawful object, and liberty to continue that work each day a sufficient time to gain more than is required for the daily needs. Hence comes the right to make contracts to serve and contracts to employ such service. There can be no contract by the employee to serve without a corresponding contract by the employer to hire and receive such service. Therefore, although the act in question provides a punishment only for the employer, its prohibition applies to both and it clearly restricts the liberty of both the employer and the employed, in the specified establishments, to freely contract with each other as to the length of a day's service or to perform such contracts when made. Consequently, it does, to that extent, take away the liberty guaranteed by this provision of the constitution.

Although this guaranty of the constitution is apparently absolute and unqualified, yet it is well established that it is subject to the exercise, by the legislature, of what are known as the police powers of the State.

Says the Superior Court of the United States in *Holden* vs. *Hardy*, 169 U. S. 391: "This right of contract, however, is in itself subject to certain limitations which the state may lawfully impose in the exercise of its police powers," a power which "may lawfully be resorted to for the purpose of preserving public health, safety, or morals, and a large discretion is necessarily vested in the legislature to determine not only what the interests of the public require, but what measures are necessary for the protection of such interests." (See, to the same effect, *Ex parte Whitwell*, 98 Cal. 78; *Ex parte Tuttle*, 91 Cal. 591; *In re Yick Wo*, 68 Cal. 297; *Lawton* vs. *Steele*, 152 U. S. 136.)

Because of the great value to mankind and the consequent paramount importance of the preservation of individual liberty, it is universally admitted and held that the police powers of the legislature are not absolute or unlimited. These personal rights can not be taken away or impaired at the mere will of the legislature, nor at all, unless the public welfare demands it. So far as the effect on himself alone is concerned, each person has the absolute right to judge for himself whether the hard labor which he voluntarily performs is for his best interest or not. The legislature can not judge for persons in this respect and interfere solely to prevent them from injuring themselves by excessive labor. The injury must be of such character and extent and to such a number of persons that it may be reasonably supposed that it will cause injury to others, that is, to the community in general, on, as it is expressed, to the public health and general welfare. (*Lawton* vs. *Steele*, *supra*.)

The means adopted to produce the public benefit intended, or to prevent the public injury, must be reasonably necessary to accomplish that purpose and not unduly oppressive upon individuals. The determination of the legislature as to these matters is not conclusive, but is subject to the supervision of the courts, and if the above qualities are wanting, a law arbitrarily interfering with the right of contract, or imposing restrictions upon lawful occupations, will be held void. (*Ex parte Whitwell*, *supra*; *Lawton* vs. *Steele*, *supra*; *Holden* vs. *Hardy*, *supra*; Tiedman, Police Powers, p. 17; Freund, Police Powers, sec. 63; Am. & Eng. Ency. of Law, 936.) In the language of Justice Harlan in *Mugler* vs. *Kansas*, 123 U. S. 161: "If, therefore, a statute purporting to have been enacted to preserve public health, the public morals or the public safety, has no real or substantial relation to these objects, or is a palpable invasion of rights secured by the fundamental law, it is the duty of the court so to adjudge, and thereby give effect to the constitution." If this were not so, the constitutional guaranties of the personal right to liberty and property would be wholly subject to the will of the majority acting through the legislature.

It is settled, however, that some occupations may have a tendency to injure the health of those engaged therein, that this injury may be so general or extensive as to affect the public health and general welfare, and that in such cases the legislature may, in the exercise of the police powers of the State, enact laws limiting the time of labor therein to eight hours a day. Thus, laws have been upheld restricting to eight hours the daily labor of persons working in underground mines, or in smelters and quartz mills, and the legislative judgment on the subject of the extent and effect of the injury was considered sufficiently supported to be beyond judicial interference. (*Holden* vs. *Hardy*, *supra*; *In re Martin*, 157 Cal. 51; *In re Martin*, 157 Cal. 60.)

So, also, it has been recognized that some occupations followed by women, though less arduous than those generally followed by men, may have such a tendency to injure their health, if unduly prolonged, that laws may be enacted restricting their time of labor therein to ten hours a day. The application of these laws exclusively to women is justified on the ground that they are less robust in physical organization and structure than men, that they have the burden of child-bearing, and, consequently, that the health and strength of posterity and of the public in general is presumed to be enhanced by preserving and protecting women from exertion which men might bear without detriment to the general welfare. (*See Commonwealth* vs. *Hamilton Mfg. Co.*, 120 Mass. 383; *Wenham* vs. *State*, 65 Neb. 394; *State* vs. *Buchanan*, 29 Wash. 602; *State* vs. *Muller*, 49 Ore. 252; *Muller* vs. *Oregon*, 208 U. S. 412; *Whitey* vs. *Blœm*, 153 Mich. 419; *Ritchie* vs. *Wayman*, 244 Ill. 509; *State* vs. *Somerville*, 122 Pac. [Wash.] 324.)

Counsel for the respondent do not advance the proposition that a general restriction of all women to eight hours a day for all work would be a proper police regulation. This precise question is not involved. The act does not limit the time of occupation or exertion by females. It limits only the time for which a female may "be employed," that is to say, engaged in service for another. The time of such service does not usually measure the whole time of daily toil, labor or exertion.

The court must always assume that the legislature, in enacting laws, intended to act within its lawful powers and not to violate the restrictions placed upon it by the constitution. We must take this statute as a law intended for a police regulation to preserve, protect or promote the general health and welfare. As has been already stated, a large discretion is vested in the legislature to determine what measures are necessary for that purpose. Upon this question of fact, as also with regard to the facts upon which a lawful classification and discrimination depends, to be hereinafter discussed, the rule is well settled that the legislative determination that the facts exist which make the law necessary, must not be set aside or disregarded by the courts, unless the legislative decision is clearly and palpably wrong and the error appears beyond reasonable doubt from facts or evidence which can not be controverted, and of which the courts may properly take notice. (*Stockton* vs. *Stockton*, 41 Cal. 159; *Ex parte Tuttle, supra; In re Spencer*, 149 Cal. 400; *In re King*, 157 Cal. 164.) The power of the court to declare a statute unconstitutional is "conceded to be always one of the utmost delicacy in its exercise, and never to be exerted except when the conflict between the statute and the Constitution is palpable and incapable of reconciliation." (*Stockton* vs. *Stockton, supra.*) If reasonable men, upon a consideration of the facts might rationally reach the conclusion that the enforcement of the statute would tend to promote or preserve, in some appreciable degree, the public health or general welfare, the law must be accredited as a proper exercise of the police power, although other reasonable persons might take a different view.

The reasons which justify a restriction upon the hours of employment or labor of women, as distinguished from men, are fully stated in the cases heretofore cited upon that subject and need not be further considered here. Restrictions to ten hours a day have always been upheld. In Illinois a restriction to eight hours in factories was declared invalid. (*Richie* vs. *People*, 155 Ill. 98.) In Washington, a similar law was held valid. (*State* vs. *Somerville, supra.*) In the latter case the woman was employed in a factory for the manufacture of paper boxes.

The question of the effect of the various occupations in which women engage, upon their health, is one upon which medical men differ and with respect to which the prevailing opinion changes from time to time. It has not been, and probably never will be, a settled question, either with respect to the deleterious effects of particular occupations, or the hours of labor which measure the limit of safety in each. Women who work for others usually have household or other domestic duties to perform which oblige them to continue at work each day for a much longer period than their time of service. Even those who live at their places of work generally have to make and mend their clothing and do other things for their personal welfare, in addition to the work done for their employers. In view of these circumstances affecting the generality of employed women, it could scarcely be claimed that a limitation to eight hours a day to the time of employment in many of the occupations mentioned in the act is unreasonable as a health regulation. The work in hotels may not be as severe as that in some of the other places covered by the law, but considering the delicate frame of women as compared with men, we can not perceive that the difference is so radical as to make it unreasonable to include employees in hotels among those protected by the law. Doubtless there is a limit below which the legislature can not go. But we can not say that eight hours of employment in work of this character in addition to the labor necessary to be done before and afterward by the employee is unreasonably low and beyond the legislative discretion, or that, in the present condition of common knowledge on the subject, the limitation upon the time of employment of women in hotels is so manifestly unreasonable and unnecessary for the promotion and preservation of the health and welfare of the human race, that the courts can declare that the legislature had no rational ground for imposing it as a police regulation for that purpose. The responsibility, if the law is unwise, is with the legislature.

3. The next objection is that the act is special because there are no reasons for making the restriction as to the particular employments mentioned in the act which do not apply with equal force to other similar occupations. There may be, and probably are, other occupations followed by women which are equally injurious to their health, and which should also be regulated. But if this be true it does not make the law invalid. If there are good grounds for the classification made by the act, it is not void because it does not include every other class needing similar protection or regulation. "The law is not rendered special by the mere fact that it does not cover every subject which the legislature might conceivably have included in it." (*Ex parte Martin*, 157 Cal. 57.)

The general rules governing this subject are well settled by our decisions. They may be stated as follows: A law is general and uniform in its operation when it applies equally to all persons embraced within the class to which it is addressed, provided such class is made upon some natural, intrinsic or constitutional distinction between the persons composing it and others not embraced in it. It is not general or uniform and it makes an improper discrimination if it confers particular privileges or imposes peculiar restrictions or disabilities upon a class of persons arbitrarily selected from a larger number of persons, all of whom stand in the same relation to the privileges granted or burdens imposed, and between whom and the persons not not so favored or burdened no reasonable distinction or substantial difference can be found justifying the inclusion of one and the exclusion of the other from such privileges or burdens. The difference on which the classification is based must be such as, in some reasonable degree, will account for or justify the peculiar legislation. The following cases declare these rules: *Smith* vs. *Judge*, 17 Cal. 555; *Pasadena* vs. *Stimson*, 91 Cal. 251; *Darcy* vs. *San José*, 104 Cal. 645; *Bloss* vs. *Lewis*, 109 Cal. 499; *Marsh* vs. *Hanly*, 111 Cal. 370; *Ex parte Jentzsch*, 112 Cal. 474; *Ex parte Giambonini*, 117 Cal. 574; *Krause* vs. *Durbrow*, 127 Cal. 684; *Pratt* vs. *Browne*, 135 Cal. 652; *Ex parte Sohncke*, 148 Cal. 267.

The women employed in hotels are, for the most part, chambermaids and waitresses. It is contended that the work of such persons in hotels is no more arduous or injurious to health than that in lodging-houses and boarding-houses, that they are all of the same class with respect to the need of such protection, and hence, that there is no substantial reason or difference in conditions which can justify the protection of those employed in hotels alone. The census returns show that in this state the number of boarding-houses and lodging-houses, combined, exceeds the number of hotels by about fifty per cent of the number of the latter. As the hotels are usually the larger institutions, it is probable that the number of women employed therein is about equal to those employed in the other places mentioned. In the matter of numbers there appears to be no ground for distinction. But there are other obvious differences. The patrons of lodging-houses and boarding-houses use them as places of residence. They are for the most part permanent occupants. Such places partake more of the nature of a home or residence than does a hotel. They are not accessible, as of right, to the public generally, as in the case with hotels. The occupants may be and often are selected by the proprietor, and frequently they compose a class having similar habits, tastes and desires. An acquaintance arises between them and the servants and the servants soon become accustomed to the wants and ways of those by whom their services are required. The occupants of a hotel are of a more transient character. They come and go and change daily. They are usually entire strangers to the servants. Their habits are likely to be irregular and of great diversity as well as unfamiliar to the employees. These respective conditions must, or at least may, make the work of such employees in the other places materially different from those similarly employed in hotels. It is not unreasonable to suppose that those in the other places will be subject to less strain and tension than those who serve the more transient, varied and indiscriminate guests of hotels, to whom they are generally entire strangers. The legislature, in view of all the above facts, may reasonably have so determined. In support of the law as already stated, the courts are bound to presume that it did make this decision, and as there are sound reasons upon which it may rest, the decision must be accepted as correct. The conditions stated appear to be a sufficient basis for the classification made. In such matters the legislature can not deal with individual cases. It can provide only for classes, and its decision as to the line of cleavage between classes in some particulars the same and in other particulars different must be upheld where it is based on any reasonable grounds. We are of the opinion, therefore, that the law can not be declared invalid because of this discrimination.

We can not say that the exemption of persons employed in harvesting, curing, canning or drying perishable fruits or vegetables from the operation of the law, makes an improper discrimination. These occupations can be carried on only for a short period of each year, the time of the annual ripening of the particular fruits or vegetables. In a cannery devoted to every kind of fruit and vegetable the work may continue much longer, but even those establishments are idle for a large part of the year. There is time for those employed therein to obtain rest and recuperation. It is also to be noted that, looking to the general welfare, there is a greater necessity for facility in obtaining employees to do such work than obtains in ordinary employment, for, unless the work is done at the proper time, great loss must ensue from the perishable nature of the products to be preserved. These are all matters which the legislature could properly take into consideration, and they constitute a sufficient justification for the exception. (See *State* vs. *Somerville*, *supra*, where it was held that a similar exception did not vitiate the women's eight-hour law of the state of Washington.)

4. The title embraces but one general subject—the regulation of female employment. The subdivision of this subject by the particular details stated in the title does not make it embrace two subjects. The title is sufficient in this respect. We

find no ground upon which the law can be declared void or the conviction in question invalid.

Let the petitioner be remanded to the custody of the sheriff of Riverside County.

OPINION NO. 2113.

SAN FRANCISCO, JUNE 14, 1911.

John P. McLaughlin, Esq., Commissioner, Bureau of Labor Statistics,
948 Market Street, San Francisco, California.

DEAR SIR: Your favor of June 11, 1911, received. Therein you state:

> "This office is in receipt of many inquiries regarding the effect of the eight hour law for females as pertaining to office help—clerks and stenographers specifically. We would be pleased to get an opinion from you on the following questions:
>
> *First*—Are stenographers and clerks working in all offices subject to the provisions of this Act?
>
> *Second*—Are women employed in the handling of perishable goods other than fruits and vegetables within its provisions?
>
> *Third*—Do women working in canning establishments, at other work than canning—such as labeling, tally clerks, packers of dried fruits, etc., come within the provisions of this act?
>
> We would be pleased to receive your opinion on these questions at your earliest convenience in order that we may be able to answer intelligently a number of letters now on file in this office."

Your first question is:

> "Are stenographers and clerks working in all offices subject to the provisions of this act?"

The law to which you refer is Chapter 258 of the Acts of 1911. The title thereof is, in part, as follows:

> "An act limiting the hours of labor of females employed in any manufacturing, mechanical or mercantile establishment, laundry, hotel, or restaurant, or telegraph or telephone establishment or office, or by any express or transportation company."

Section 1 of the act is as follows:

> "No female shall be employed in any manufacturing, mechanical or mercantile establishment, laundry, hotel, or restaurant, or telegraph or telephone establishment or office, or by any express or transportation company in this state more than eight hours during any one day or more than forty-eight hours in one week. The hours of work may be so arranged as to permit the employment of females at any time so that they shall not work more than eight hours during the twenty-four hours of one day, or forty-eight

> hours during any one week; provided, however, that the provisions of this section in relation to the hours of employment shall not apply to nor affect the harvesting, curing, canning or drying of any variety of perishable fruit or vegetable.''

It is a general rule of law that, in the construction of statutes, punctuation may be disregarded, but this rule does not mean that a court may repunctuate a statute, so as to change its meaning, where its meaning is perfectly plain, for such punctuation would be legislation.

Where a particular clause or sentence of a statute is so ungrammatical, or so punctuated, as not to make sense, when the intention of the legislature is clearly ascertainable from the context and statutes *in pari materia,* the court will put the construction on the statute intended by the legislature, and for such purpose, may change the punctuation to express such intention, but where a statute is grammatically accurate, and its meaning is not obscured, its scope cannot be extended by repunctuation.

In this statute, the division of employments to which the act refers is made very clear, both in the caption and in the first section of the act. If the legislature had intended that the act should apply to stenographers and clerks in all offices, it would have placed the words ''or office'' after the words ''or restaurant,'' in all probability.

We are not at liberty to extend the scope of this act, by adding a comma after the word ''establishment.'' To do so would be direct legislation by the judicial branch of the government.

A good discussion of this subject, with pertinent cases, in the Supreme Court of the United States, will be found in *United States* vs. *York,* 131 Fed. 326. I quote therefrom as follows:

"But another grave objection to the indictment remains, and in this instance both the revisers and congress have left a serious gap to be bridged by judicial interpretation before a most important part of section 5424 can be made applicable to the present case, or to other grave acts which, as it is urged, should be contained within it, and which were contained in section 2 of the act of 1870. The revisers and Congress, with apparent deliberation, have omitted words from the new section that were within the earlier law. Section 5424 provides:

> 'Every person applying to be admitted a citizen or appearing as a witness for any such person, who knowingly personates any other person than himself, or falsely appears in the name of a deceased person, or in an assumed or fictitious name, or falsely makes, forges, or counterfeits any oath, notice, affidavit, certificate, order, record, signature, or other instrument, paper, or proceeding required or authorized by law, relating to or providing for the naturalization of aliens; or who utters, sells, disposes of, or uses as true or genuine, or for any unlawful purpose, any false, forged, antedated, or counterfeit oath, notice, certificate, order, record, signature, instrument, paper, or proceeding above specified; or sells or disposes of to any person other than the person for whom it was originally issued any certificate of citizenship, or certificate showing any person to be admitted a citizen, shall be punished by imprisonment at hard labor not less than one year, nor more than five years, or by a fine of not less than three hundred nor more than one thousand dollars, or by both such fine and imprisonment.'

It will be observed that after the word 'or,' and before the words 'who utters,' etc., are omitted the words 'every person,' with which the section opens. The same omission occurs in the third auxiliary clause of the section. Hence 'who,' as so used, and wherever used in the section, refers to the initial 'every person.' But such words 'every person' are modified by the words 'applying to be admitted a citizen. or appearing as a witness for any such person.' Hence, as the section literally reads, a person uttering a certificate can only be punished in case he was a 'person applying to be admitted a citizen, or appearing as a witness for any such person.' The indictment does not charge that Bunoro, the principal, was either a 'person applying to be admitted a citizen, or appearing as a witness for any such person,' and it was admitted upon the argument that he was not such person. In section 2 of the act of 1870 the language is:

> 'If any person applying to be admitted a citizen, or appearing as a witness for any such person shall knowingly personate any such person, . . . or if any person shall falsely make, forge, or counterfeit any oath, affirmation, notice, affidavit, certificate,' etc.

That is, before each 'who' in each auxiliary clause in the former section the words 'any person' are repeated without the qualifying words. The revisers and Congress with apparent intention have omitted to repeat the words 'every person' in any auxiliary clause, but have left each relative 'who' referring to 'every person applying to be admitted a citizen, or appearing as a witness for any such person.' Hence, to sustain the indictment, the court must reinstate before each 'who' the words 'any person,' so carefully used in the former act, and painstakingly omitted from section 5424, except at the beginning thereof, where the words 'every person' are used. The section, in fit terms, limits the persons punishable to a certain class. The question is whether the court may interpolate in a penal statute words which the revisers and congress have twice rejected, and by such interpolation bring under its penalty new classes of offenses. The government vehemently urges that, unless the effect of the old statute be given to the new, persons punishable under the old law may escape. It is sufficient answer that the responsibility rests upon the revisers and Congress.

In *United States* vs. *Goldenberg*, 168 U. S. 95, 102, 18 Sup. Ct. 3, 42 L. Ed. 394, it is said:

> 'The primary and general rule of statutory construction is that the intent of the lawmaker is to be found in the language that he used. He is presumed to know the meaning of words and the rules of grammar. The courts have no function of legislation, and simply seek to ascertain the will of the legislator. It is true, there are cases in which the letter of the statute is not deemed controlling, but the cases are few and exceptional, and only arise when there are cogent reasons for believing that the letter does not fully and accurately disclose the intent. No mere omission, no mere failure to provide for contingencies which it may seem wise to have specifically provided for, justify any judicial addition to the language of the statute.'

In *United States* vs. *Harris*, 177 U. S. 309, 20 Sup. Ct. 611, 44 L. Ed. 780, it is said:

> 'Giving all proper force to the contention of the counsel of the government that there has been some relaxation on the part of the courts in applying the rule of strict construction to such statutes, it still remains that the intention of a penal statute must be found in the language actually used, interpreted according to its fair and obvious meaning. It is not permitted to courts, in this class of cases, to attribute inadvertence or oversight to the Legislature when enumerating the classes of persons who are subjected to a penal enactment nor to depart from the settled meaning of words or phrases in order to bring persons not named or distinctly described within the supposed purpose of the statute.'

Mr. Chief Justice Shiras, in delivering the opinion of the court in the above case, quotes the language of Mr. Chief Justice Marshall in *United States* vs. *Wiltberger*, 5 Wheat. 76, 5 L. Ed. 37, as follows:

> 'The rule that penal laws are to be construed strictly is perhaps not much less old than construction itself. It is founded on the tenderness of the law for the rights of individuals, and on the plain principle that the power of punishment is vested in the legislative, and not in the judicial department. It is the legislature, not the court, which is to define a crime and ordain its punishment. It is said that, notwithstanding this rule, the intention of the lawmaker must govern in the construction of penal as well as other statutes. But this is not a new, independent rule which subverts the old. It is a modification of the ancient maxim, and amounts to this: That, though penal statutes are to be construed strictly, they are not to be construed so strictly as

> to defeat the obvious intention of the legislature. The maxim is not to be applied so as to narrow the words of the statute to the exclusion of cases which those words in their ordinary acceptation, or in that sense in which the legislature obviously used them, would comprehend. The intention of the legislature is to be collected from the words they employ. Where there is no ambiguity in the words, there is no room for construction. The case must be a strong one indeed which would justify a court in departing from the plain meaning of words, especially in a penal act, in search of an intention which the words themselves did not suggest. To determine that a case is within the intention of a statute, its language must authorize us to say so. It would be dangerous indeed to carry the principle that a case which is within the reason or mischief of a statute is within its provisions so far as to punish a crime not enumerated in the statute, because it is of equal atrocity or of a kindred character with those which are enumerated. If this principle has ever been recognized in expounding criminal law, it has been in cases of considerable irritation, which it would be unsafe to consider as precedents forming a general rule in other cases.'

In *Lake County* vs. *Rollins*, 130 U. S. 670, 9 Sup. Ct. 652, 32 L. Ed. 1060, Mr. Justice Lamar said:

> 'To get at the thought or meaning expressed in a statute, a contract, or a constitution, the first resort in all cases is to the natural signification of the words in the order of grammatical arrangement in which the framers of the instrument have placed them. If the words convey a definite meaning, which involves no absurdity, nor any contradiction of other parts of the instrument, then that meaning apparent on the face of the instrument must be accepted, and neither the courts nor the legislature have the right to add to it or take from it.'

There are occasions when earlier statutes can be consulted. The Supreme Court has stated the rule. In *United States* vs. *Bowen*, 100 U. S. 513, 25 L. Ed. 631, it said:

> 'The revised Statutes must be treated as the legislative declaration of the statute law on subjects which they embrace on the 1st day of December, 1873. When the meaning is plain, the courts cannot look to the statutes which have been revised to see if congress erred in that revision.'

This is approved in *Victor* vs. *Arthur*, 104 U. S. 498, 26 L. Ed. 633:

> 'The decisive question is whether section 728 is to be construed as an independent act, or whether the plaintiff is at liberty, by referring to the prior act from which it was taken, to show that it was the intention of congress to limit it to the cases named in such prior act. The general rule is perfectly well settled that where a statute is of doubtful meaning, and susceptible upon its face of two constructions, the court may look into prior and contemporaneous acts, the reasons which induced the act in question, the mischiefs intended to be remedied, the extraneous circumstances, and the purpose intended to be accomplished by it, to determine its proper construction. But where the act is clear upon its face, and when standing alone it is fairly susceptible of but one construction, that construction must be given to it.' *Hamilton* vs. *Rathbone*, 175 U. S. 419, 20 Sup. Ct. 155, 44 L. Ed. 219.

The subordinate clause of the sentence in section 5424 relates to a—

> 'Person applying to be admitted a citizen, or appearing as a witness for any such person, who knowingly personates any other person than himself, or falsely appears in the name of a deceased person, or in an assumed or fictitious name, or falsely makes, forges, or counterfeits any oath, notice, affidavit, certificate, order, record, signature, or other instrument, paper, or proceeding required or authorized by any law relating to or providing for the naturalization of aliens.'

Now, observe how the second clause (the one in question) specifically refers to the acts enumerated in the first clause. It proceeds 'or who utters, sells, disposes of, or uses as true or genuine, or for any unlawful purpose, any false, forged, antedated, or counterfeit oath, notice, certificate, order, record, signature, instrument, paper, or proceeding above specified'; and the section continues, 'or sells or disposes of to any person other than the person for whom it was originally issued any certificate of citizenship, or certificate showing any person to be admitted a citizen.' The section is harmonious in its several parts. 'Every person applying,' etc., is forbidden to personate, to falsely appear in the name of another, or in a fictitious name, to falsely make, to forge, to counterfeit, any oath, notice, etc., or to utter, sell, dispose of, to use as true, any such papers, or to sell any certificate, etc. The intention is that a person applying, etc., shall not personate, nor make false naturalization papers; that he shall not utter, sell, or use the same, nor sell or dispose of any certificate. The section is free from all ambiguity. It is grammatically correct. Its provisions are consistent one with another. They are applicable to cases that might arise. They do not cover all classes of offenders included in the act of 1870. If it be admitted that they should cover such classes, yet they plainly do not. The revisers and Congress could not have read the section without observing the omission. They deliberately took out words from the earlier act that were palpably necessary to cover such offenses. This court is not permitted to interpolate words that the revisers and congress rejected. The section is sensible. It is accurate. If the public welfare demands that it should be broader, the power rests alone with congress to amplify it.

The court recognizes with what care the learned counsel for the government has marshaled and submitted the rules of construction and the sustaining authorities. But in the present case there is no occasion for resorting to rules of construction. Their aid is neither required nor justified, because the language of section 5424 is plain. There is no doubt of its meaning. It is free from ambiguity. The legislature means what it says, and its words declare its meaning. Why look beyond the words in such case? The government insists that the meaning is obscure. That is the vice of its argument. The meaning is unclouded.

It is finally urged that the section should be repunctuated to give the words a meaning that they do not now express. The proposition is to repunctuate a statute so as to include classes that are clearly excluded, when there is not the slightest evidence on the face of the statute of an intent to include them. The proposition is to punctuate the section so as to make it read as if it contained the very words that were in the old statute, which words the revisers and Congress have omitted. The situation is this: The earlier statute contained words that included various classes of offenders. The revisers and congress omitted some of them. The proposal is that the section be repunctuated so that it will be equivalent to a statute with the omitted words present. That would be grave interference with legislative action. The extent to which counsel for the government asks the court to go in the matter of reconstruction of the statute is illustrated by the following extract from his argument:

> 'Every person, (comma inserted) applying to be admitted a citizen (comma) omitted) or appearing as a witness for any such person, who knowingly personates any other person than himself, or falsely appears in the name of a deceased person, or in an assumed and fictitious name, or falsely makes, forges, or counterfeits any oath, notice, affidavit, certificate, order, record, signature, or other instrument, paper, or proceeding required or authorized by any law relating to or providing for the naturalization of aliens; or, (comma inserted) who utters, sells,' etc.
>
> The government advocates the change as follows:
>
> 'By thus transposing the comma in the first portion of this section, it would be clear that the first clause was intended to cover every person who applies to be admitted a citizen, or appears as a witness and knowingly personates, etc., and the second clause as thus punctuated ("or, who utters, sells," etc.) would relate to the principal subject "every person," and would clearly mean "or every person who utters, sells," etc. The entire sentence, grammatically analyzed, is a simple declarative sentence; the subject being "person," the predicate being "punished," and the object "imprisonment;" the subject being qualified by the complex adjective clauses "applying to be admitted a citizen" and "knowingly personating," etc., and the second of the complex qualifying clauses being "who utters, sells," etc.' It is at least doubtful whether this punctuation would demand or even justify the construction urged by the government. In any case, it is considered that the plain reading of the section, and the intention of the congress as gathered from it, should not be thwarted by such corruption of the text."

So here, we would have to repunctuate the statute so as to include clauses which are clearly excluded, when there is not the slightest evidence on the face of the statute of the intent to include them.

Therefore, I am of opinion that the regulatory provisions of the statute do not apply to stenographers and clerks working in offices, except such as are working in telegraph or telephone offices, express or transportation companies, or in manufacturing, mechanical, or mercantile establishments, laundries, hotels, or restaurants.

> *Second*—"Are women employed in the handling of perishable goods other than fruits and vegetables within its provisions?"

Section 1 of the act provides, in part, as follows:

> "*provided, however,* that the provisions of this section in relation to the hours of employment shall not apply to nor affect the harvesting, curing, canning or drying of any variety of perishable fruit or vegetable."

This proviso is an exception to the general provisions of the statute, and must be construed strictly. Its meaning is entirely plain, and there is no need to travel outside the ordinary meaning of the language to ascertain the intention of the legislature. This proviso only refers to the handling of perishable fruits or vegetables, and, therefore, women employed in the handling of perishable goods, other than such fruits or vegetables, are within the purview of the act, but not within the purview of the exception.

Davis vs. *Hart,* 123 Cal. 387.

> *Third*—"Do women working in canning establishments, at other work than canning—such as labeling, tally clerks, packers of dried fruits, etc., come within the provisions of this act?"

Again, we must construe the proviso according to its plain meaning and intent, in accordance with the purpose intended to be accomplished by the legislature. The only purpose of the proviso was that the hours of employment prescribed by the act should not be allowed to interfere with the harvesting, curing, canning or drying of fruits or vegetables which might be likely to spoil, if they were left right in the midst of the operation by a cessation of labor. After fruits or vegetables have been harvested, cured, canned or dried, they are no longer perishable and the object of the proviso ceases. Then comes the work of labelers, tally clerks, and packers. These employees have nothing to do with the handling of the perishable fruits and vegetables, before they have become preserved by the various measures used in curing, canning or drying thereof. These employees, in my opinion, come within the purview of the act, but not within the purview of the exception.

Yours very truly,

U. S. WEBB, Attorney General.
By R. C. VAN FLEET, Deputy.

OPINION NO. 2262.

SAN FRANCISCO, CAL., May 15, 1912.

Hon. John P. McLaughlin, Commissioner Bureau of Labor Statistics,
San Francisco, Cal.

DEAR SIR: I have your communication of March 14, 1912, in which you submit the following questions for my opinion:

> "(1) When street work is done, pursuant to an award by municipal authorities after public bids, under the provisions of the Vrooman act, is such work considered public work, and do the provisions of section 653*c* and 653*d* of the Penal Code—relating to employees on public works; and Statutes of 1901, page 589, relating to the employment of aliens on public works; and section 17, article XX of the Constitution, relating to hours of labor on public works, apply to the street work above mentioned.
>
> (2) Under the provisions of Statutes of 1901, page 589, relating to the employment of aliens on public works, may an alien who has declared his intention to become a citizen be employed upon public works."

Section 17 of article XX of the Constitution provides that:

> "The time of service of all laborers or workmen or mechanics employed upon any public works of the State of California, or of any county, city and county, city, town, district, township, or any other political subdivision thereof, *whether said work is done by contract or otherwise,* shall be limited and restricted to eight hours in any one calendar day. . . ."

Section 653*c* of the Penal Code reads in part as follows:

> "The time of service of any laborer, workman, or mechanic employed upon any of the public works of the State of California or of any political subdivision thereof or upon work done for said state or any political subdivision thereof is hereby limited and restricted to eight hours during any one calendar day; and it shall be unlawful for any officer or agent of said state or of any political subdivision thereof *or for any contractor or subcontractor doing work under contract upon any public works aforesaid, who employs or who directs or who controls the work of any laborer, workman, or mechanic employed as herein aforesaid* to require or permit such laborer, workman, or mechanic to labor more than eight hours during any one calendar day. . . ."

In the section of the Constitution above referred to, it is provided that:

> " . . . the legislature shall provide by law that a stipulation to this effect shall be incorporated in all contracts for public work and prescribe proper penalties for the speedy and efficient enforcement of such law."

It is under the authority thus granted to the legislature that the section of the Penal Code above referred to was adopted, and it will be seen from a reading of both the constitutional section and the penal statute that the limitation upon the hours of labor refers to all contracts for labor to be performed directly for the State or any of its political subdivisions, whether such laborers are employed directly by the State or any political subdivision thereof or whether they are employed by a contractor or subcontractor of the State or one of its political subdivisions. It is, therefore, unnecessary to determine whether street work done pursuant to the provisions of the Vrooman act under a contract awarded after public bids had been received is public work, though I am of the opinion that all work of this nature which directly affects the public interest, whether it be to the interest of the entire community of any political subdivision of the State or to a single portion thereof, is public work within the contemplation of the Constitution and the Penal Code.

The Statutes of 1901, page 589, relating to the employment of aliens on public works presents a different question. Section 1 of this act reads as follows:

> "No person, except a native born or naturalized citizen of the United States, shall be employed in any department of the state, county, city and county, or incorporated city or town government in this state."

Nowhere in the act is there any express language applying its terms to the employment of aliens by contractors who contract with the city to perform any public work. It seems to be the clear intention of the act not to extend its provisions to such contractors and I am of the opinion that the legislature is without power to so limit the right of employment.

In *City Street Improvement Company* vs. *Kroh,* 158 Cal. 308, our Supreme Court had occasion to pass upon the validity of a contract which had been let by the Highway Commissioners of San Joaquin County for the purpose of constructing and repairing certain roads in that county. The specifications upon which sealed bids were asked contained a stipulation that no unnaturalized aliens should be employed in the work; in holding that the board of supervisors were without power to insist upon a specification to that effect the Supreme Court said:

> "The provision of the specifications to the effect that, except by permission of the highway commission, no unnaturalized alien shall be employed in the work, is invalid and unenforceable when attempted by public authorities. The Constitution provides that all men have the inalienable right of enjoying liberty and acquiring property, and that foreigners of the white race, eligible to citizenship, while *bona fide* residents of the State, shall have the same right to acquire property as native born citizens. (Const., art. I, secs. 1, 17.) Laws forbidding the employment of aliens have been held invalid. (*Chicago* vs. *Hulbert,* 205 Ill. 363 (68 N. E. 786); *People* vs. *Warren,* 34 N. Y. Supp. 943 (13 Misc. 615.) Such a law would violate the treaties with almost all the nations from which this country receives immigrants. (See *Estate of Ghio,* 157 Cal. 552 (108 Pac. 516). The statute in question charges the supervisors with the duty of administering the scheme for building roads, but it does not purport to confer power to make or enforce a provision of this character. They have, no doubt, a wide discretion as to the manner of carrying on the work and may adopt any measure reasonably tending to facilitate the same, or perhaps any which may incidentally further any laudable public purpose. But they are not given authority to put restrictions upon the contractor which can only hinder the work, which make it more expensive, and which have no relation whatever to the thing to be done, or to any conceivable legislative purpose disclosed by the statute, and which would be a direct attempt to discriminate against one class of *bona fide* residents of the state and favor another, a violation of treaty obligations and contrary to the principles of the

constitution. No express authority for such a provision is given and we are satisfied that the supervisors have no implied power to impose such a mischievous and burdensome restriction. A violation of it by the contractor would not defeat his right to recover the contract price upon performance of the work."

The same question was involved in the case of *City of Chicago* vs. *Hulbert*, 68 N. E. 786; in holding that a statute of the State of Illinois, providing for street improvement under the assessment plan (which statute is, in all respects, similar to that of the Vrooman act), and which provided that it should be unlawful for any officer or any contractor to employ any person other than a citizen upon any public contract, was invalid, the court used the following language:

"It is now insisted by appellees that the proceedings are void, and that this ordinance can not be sustained because paragraph 10 of chapter 6 of our statutes, entitled 'Aliens,' was not compiled with (Hurds Rev. St. 1901, p. 141). That paragraph provides that 'it shall be unlawful for any . . . officer . . . acting for . . . any city . . . or any contractor or subcontractor, under any or either of said municipalities, to employ any person or persons, other than native born or naturalized citizens, or those who have in good faitth declared their intentions to become citizens of the United States, when such employees are to be paid, in whole or in part, directly or indirectly out of any funds raised by taxation.' Paragraph 11 of the same statute requires any one employing labor to be paid out of the public funds to make a list of the persons so employed, showing that they meet the requirements of the foregoing paragraph, and paragraph 12 fixes a penalty for a violation of paragraph 11. Appellees took evidence showing that this statute was not complied with, and insist that, as these public funds go to the contractor who violated that law, the ordinance cannot be sustained. A similar law was enacted by ordinance in the city of Chicago and we have repeatedly held that such law is invalid, as it is in contravention of the Constitution and the right of individuals to contract. The statute in question is void upon the same grounds, and neither the city nor the contractor was under any obligation to observe it."

And so in *Inge* vs. *Board of Public Works*, 135 Ala. 187, 93 Am. St. Rep. at page 28, the Supreme Court of the State of Alabama in holding that the stipulation in a municipal contract for street improvements prohibiting the contractor to employ alien laborers was void, used the following language:

"The stipulation in the contracts against the employment by the contractor of alien or convict labor presents a question which has received consideration in a number of cases in the courts of the country. This condition was contained in the specifications, which formed the basis of the bids called for. It narrowed the field for the employment of labor, and was a restriction upon the contractor that naturally tended to make him increase the price of his bid. Such a limitation is directly opposed to the interest of the taxpayer, who is entitled to have the work done at the lowest cost. The authorities are generally agreed that such a provision invalidates the contract. The following cases discuss the principle here involved and contain citations of other authorities: *People* vs. *Coler*, 166 N. Y. 1, 82 Am. St. Rep. 605, 59 N. E. 716; *Baker* vs. *Portland*, 5 Saw. 566, Fed. Cas. No. 777; *People* vs. *Warren*, 13 Misc. Rep. 615, 34 N. Y. Supp. 942; *Holden* vs. *City of Alton*, 179 Ill. 323, 53 N. E. 556."

There are many authorities supporting the proposition that a state is without power to limit the right of employment of alien laborers where the right of free employment is given to such aliens by the terms of the treaties existing with the United States; but it is unnecessary to quote further authority here, the decision in *City Street Improvement Company* vs. *Kroh*, above quoted, being the authority in this State.

You are accordingly advised that as to the hours of labor, the provisions of section 17 of article XX of the State Constitution and of section 653*c* of the Penal Code are applicable to all contracts awarded by municipal authorities after public bids under the provisions of the Vrooman act, but that the provisions of the Statute of March 23, 1901, (Stats. 1901, p. 589) relating to alien laborers is not applicable to such contracts.

As section 1 of the act of March 23, 1901, prohibits the employment of any person who is not a native born or *naturalized* citizen, it is evident that an alien who has merely declared his intention to become a citizen is not eligible to such employment; you are, therefore, advised that where public work is being done under the provisions of the Vrooman act, where the charter of the particular city wherein such work is being performed is silent on the question, the provisions of the statute of March 23, 1911, apply to all employees of the city whose wages are paid directly by the city, and that an alien who has merely declared his intention to become a citizen and who has not actually been naturalized is not eligible, either as an officer or employee of the State, or of any county, city and county or incorporated city or town thereof, excepting that in any chartered city it is competent for the charter to provide the qualifications of the officers and employees of the city, and where such provision is made the provisions of this act are inapplicable.

Very truly yours,

U. S. WEBB, Attorney General.
By John T. NOURSE, Deputy.

OPINION NO. 2298.

SAN FRANCISCO, June 3, 1912.

John P. McLaughlin, Esq., State Labor Commissioner, San Francisco.

DEAR SIR: I have your communication of April 25, 1912, wherein you ask to be advised whether under the laws of this State a nonresident child, temporarily within the State with a traveling theatrical organization, who is not engaged in any acrobatic act, ropewalking or wirewalking act, singing or dancing turn, or in any vocation which is immoral or injurious to the health or dangerous to the life or limb of the child, but who merely has a walking or speaking part, is debarred from such participation.

There are two acts which demand consideration in this connection. First, the amendment to section 272 of the Penal Code (Stats. 1905, p. 759), and, second, the compulsory education and child labor laws, as amended at the regular session of the legislature in 1911 (Stats. 1911, pp. 482 and 456).

As to the section of the Penal Code referred to, it is clearly its purpose to prohibit the participation of children of less than sixteen years in acrobatic stunts, dangerous acts, singing and dancing turns, or any acts which are injurious to the health or dangerous to the life or limb of the child, or which are connected with an indecent or immoral exhibition. Before its amendment in 1905, this section prohibited the participation of children under sixteen years of age in singing, dancing and acrobatic acts in a public street or in a wandering or mendicant business, the purpose being to prevent children from taking part in circuses or street performances of a low character. Before its amendment in 1905, the act had no reference to participation of children in legitimate theatrical performances.

By the amendment of 1905, all participation in the acts mentioned in the section was prohibited, whether the exhibition was given upon a street or in a theatre or vaudeville house. Though the prohibited acts of the former section were continued in the amendment, and additional acts were prohibited by the amendment, it does not appear that the legislature has expressed any intention by this section to prohibit mere walking or speaking parts in legitimate theatrical productions. Inasmuch as the statute is criminal, the rule of strict construction must be applied, and, adopting this construction, I am of the opinion that such acts are not prohibited by the terms of the section.

As to the compulsory education and child labor laws of 1911, it seems clear that they are made applicable only to children resident within the State.

Section 1662 of the Political Code provides that the public schools of the State shall be open to children "residing in the district." A member of a traveling theatrical troupe who merely visits a city or town for the purpose of giving theatrical performances, and with no intention of residing there, is not a resident of the district within the meaning of this section.

The act of April 21, 1911 (Stats. 1911. p. 482), provides for the compulsory education of all children of the State within the ages of eight and fifteen years, establishes a penalty for failure upon the part of a parent or guardian to comply with the terms of the act, and authorizes the creation of parental schools for the purpose of detaining truant children and compelling them to attend school under the supervision of truant officers.

The act of April 14, 1911 (Stats. 1911, p. 456), after prohibiting the employment of minors in certain specified places of employment, provides that no child under fifteen years of age shall be employed in any " . . . place of amusement," but an exception is made in that the judge of the juvenile court or county, or city and county, *in which such child resides* shall have the power to issue a permit to any such child to work in any of the employments otherwise prohibited by the act.

Under the terms of the compulsory education law, as none but residents of the district are entitled to the benefits of attendance in the public schools of the district, it is evident that none but residents are subject to the compulsory provisions of the statute. Under the provisions of the act of April 14th, known as the "Child Labor Law," it is evident that the legislature intended to legislate for the children of the State only, and that it was not the intention to prohibit employment in the places of employment other than specified excepting as to children resident of the State.

You are therefore advised that a nonresident child is not debarred from participation in a walking or speaking part of a purely theatrical production,—that is to say, the provisions of the act of April 14th and of the act of April 21, 1911, do not apply to a nonresident child temporarily within the State, and that such child is entitled to engage in any employment with a theatrical company which is not expressly prohibited by the terms of section 272 of the Penal Code.

I return herewith brief of Mr. Ligon Johnson on this subject.

Yours very truly,

U. S. WEBB, Attorney General.
By JOHN T. NOURSE, Deputy.

BRIEF OF LIGON JOHNSON.

SAN FRANCISCO, April 25, 1912.

Hon. J. P. McLaughlin,
Commissioner of Labor.
948 Market Street, San Francisco.

DEAR SIR: I am informed that, in California, the right of children to participate in dramatic productions has been questioned and the members of the National Association of Theatrical Producing Managers, of which I am general counsel, have requested me to obtain some definite ruling upon this matter before the bookings for the next theatrical season are completed. I have carefully read the laws of California regarding the employment of children, and, in the case of those children who are but temporarily in the State, and with a theatrical company passing through California as part of its general tour, in the presentation of a legitimate dramatic production, I fail to find any enactment which, to my mind, would bar such children in the pursuit of their dramatic education and participation in legitimate dramatic work with such companies.

I wish to make it clear that my inquiry relates merely to walking and speaking parts and participation in a regular play. It has no relation to those occupations prohibited under Penal Code, section 272, and I concede that under the penal laws of this State a child is prohibited from engaging in acrobatic stunts, rope and wire walking acts, mere singing and dancing turns, or in any other vocation which is immoral, injurious to the health or dangerous to the life or limb of the child. My inquiry relates solely to the participation of a child, under proper and moral surroundings, in a regular dramatic production, and in work which is in itself educational and beneficial.

While this particular point may not be directly involved, I desire in the beginning to call your attention to the fact that the stage child is not engaged in any ''work'' under the ordinary acceptance of the term. If work at all, it is ''educational work,'' and, according to the testimony of our leading dramatic artists, absolutely essential in youth if the highest type of artist is to be developed. This training must be had in early youth, during the plastic period of the child and before self-consciousness has set in.

The theatre is the only school possible for this training and while participating in dramatic work the child is actually in school. There are some zealous but misinformed people who cannot distinguish between the few moments of mental effort of the stage child, effort spent in actual educational training, followed by periods of rest, recreation and general study, from the blind, constant and degrading toil of the little slave of the mill or factory, whose drudgery dwarfs mind, body and spirit and prohibits all opportunity for study and ability to study if opportunity could be found.

Again, the child of the mill often does a man's work at a child's pay. The reverse is true of the stage child whose presence is necessary if the purest themes of the drama are to be given. When the essence of childhood comes in, the higher emotions are always appealed to, and the very fact that the purity of childhood is to be presented prohibits those themes appealing to the baser instincts.

Now as to the law as I understand it.

California has two laws concerning children, one a general criminal statute (section 272, Penal Code) which applies generally, and the other the combined compulsory education and child labor laws which, if my construction is correct, applies only to children residents within the State.

I think it will at once be conceded that section 272 of the Penal Code, while prohibiting the acrobatic stunts, dangerous acts, mere singing and dancing turns and the like, has no application to a child in a legitimate dramatic production where there can be no question that its surroundings are not such as to be ''injurious to the health or dangerous to the life, or limb of such child'' and where it does not participate ''in any obscene, indecent or immoral exhibition.'' No child is taken in any dramatic production for the mere purpose of singing, or playing on musical instruments or for use in the other things specified. These forbidden acts were formerly witnessed in circuses and occasionally on the vaudeville stage but never in any legitimate dramatic production.

Therefore, so far as my present inquiry is concerned, I believe section 272 of the Criminal Code may be dismissed from further consideration.

There remains then but the Compulsory Education and Child Labor Law (which are so closely united that they are practically one law) to be considered.

Of these laws but one provision offers any possibility for controversy and that is under section 2 of the law with relation to employment and hours of labor which declared:

> "No child under fifteen years of age shall be employed in any mercantile institution, office, laundry, manufacturing establishment, workshop, *place of amusement*, restaurant, hotel, apartment house, or in the distribution or transmission of merchandise or messages."

To properly consider this it is necessary to consider the object and scope of educational and labor laws.

Regardless of the opinion as to the results accomplished, the true object of every educational and child labor law is the protection of the mental, moral and physical welfare *of the children of the state enacting the legislation,* its prospective citizens and voters. Each state legislates for its own charge, for its own children, after the belief of its own legislators. Each state assesses its own citizens and property owners for funds to educate its children and the children of no other state can share in these contributions by the state to its children's welfare.

The mere fact that a child or its parents are citizens of the United States gives no rights under the educational laws of any state but those of the state in which the child actually resides. The provisions as to school attendance reaches only those children who are residents of the State, prospective citizens and voters of such state. Educational laws are on a par with laws relating to the ballot and compulsory education laws no more apply to nonresidents than do the laws granting a right to vote apply to persons in the state who merely are on a trip through it.

No state will be presumed to tax its citizens for the benefit of the citizens of any other state or nation, and no nonresident can acquire any right under the educational laws of any state, nor does any duty devolve upon him under such laws.

This has been repeatedly declared by the courts of California and those of the various other states of the Union.

The decisions of the courts are uniform on this point. In California, as long ago as the case of *Ward* vs. *Flood,* 48 Cal. 49-51, it was held:

> "The opportunity of instruction in public schools given by the statute to the youth of the State, is in obedience to the special command of the State Constitution, and the privilege thereby granted is a legal right, as much as a vested right in property" (head note).
>
> "The education of youth is emphatically their protection. . . . Thus it is the acknowledged duty of the parent or guardian, as part of the measure of protection which he owes the child or ward, to afford him at least a reasonable opportunity for the improvement of his mind and the elevation of his moral condition and of this duty the law took cognizance. . . . The public law of the State, both the constitution and statute, having established public schools for educational purposes, to be maintained by public authority and at public expense, the youth of the *State thereby become pro hac vice wards of the state,* and under the operations of the constitutional amendment referred to, equally entitled to be educated at the public expense." . . .
>
> "It will readily be conceded that the privilege accorded to the youth of the State, by the law of the State, of attending public schools maintained at the expense of the state, is not a privilege or immunity appertaining to a citizen of the United States, as such."

This has been even more strongly expressed in the decisions of other states. In *Wheeler* vs. *Burrows,* 18 Ind. 14, it was held:

> "The legal domicile and residence of a minor, not emancipated, is that of his parents."
>
> "Parents residing in another state cannot send their children into this State for the purpose of procuring an education, and enable them to acquire such a residence here as will entitle them to admission into the public schools of this state, unless circumstances are such as will create bona fide legal residence here."
>
> "The complainant is more than five and less than eighteen years of age and has resided in the city at least one year, and now resides therein, in the family of

Marcus Sherwood, but under the control of his brother. . . . the plaintiff's father and mother reside and are domiciled in Tennessee. . . .

"As a general rule the domicile of a minor, not emancipated, is that of his parents," 1 Am. head cases, 714, 13 Ind. 167; and we perceive nothing in the facts before us to make this case an exception to the rule. Evidently the domicile of the plaintiff was in Tennessee, not in Indiana; and she was not, therefore, in legal contemplation a resident of the city of Evansville."

I also quote you the ruling of other states:

"A residence for school purposes cannot be gained by an indenture of apprenticeship if the articles are for the purpose of giving the child the benefit of a school where the one to whom he is apprenticed resides." *School District* vs. *Bragdon*, 23 N. H. 507.

"Persons who reside on lands purchased by or ceded to the United States for navy yards, forts, and arsenals, and where there is no other reservation or jurisdiction to the State than that of a right to serve civil and criminal process on such lands, are not entitled to the benefits of the common schools for their children, in the towns at which the lands are situated." *In re opinion of Justices*, 42 Mass. (1 Metc.) 580.

"Towns and cities are not authorized by law to open their schools to children whose parents or guardians reside in another state" . . . (head note). "The provisions of the General Statutes, ch. 41, 87, that with the consent of the school committee first obtained, children of certain ages may attend schools in towns or cities other than those where their parents or guardians reside, apply only to children whose parents or guardians reside in Massachusetts." *Inhabitants of Haverhill* vs. *Gale*, 103 Mass. 104.

"Children cannot acquire the right to attend school by being sent to board with a relative residing within the district and attending school a few weeks before the fact of nonresidence was discovered." *People* vs. *Board of Education*, 26 Ill. App. 476.

Not only have children of non-resident parents but temporarily within the state no right to attend public school, but the schools are declared to have no right to receive them, and if such children have been taught in the public schools under agreement to pay tuition, such tuition cannot be collected.

The head note of *Haverhill* vs. *Gale*, 103 Mass. 104, is the clearest exposition of this rule, in which case it is said:

"Towns and cities are not authorized by law to open their schools to children whose parents or guardians reside in another state; and if they do so, no promise, expressed or implied, of parents or guardians to pay for tuition can be enforced."

With relation to the children of nonresidents, the true rule appears to be that the child has a right to attend school (and in consequence the State has the right to enforce such attendance) where the child is in the State and there is no immediate and definite intention to remove it from the State.

"A child living with a domiciled resident and taxpayer of a school district as a member of his family with the expectation on the part of all parties that this relationship will continue permanently, although she has never been adopted and her parents live in another state so that she has not a domicile in a technical sense of that term, has a 'residence' there for school purposes, and cannot be compelled to pay tuition." *Yale* vs. *West Middle School District*, 59 Conn. 489.

"To establish a rule that a minor cannot have a residence for school purposes other than that of his parents would in many cases deprive him of all benefits of the school. When a minor has poor parents, the poverty of the parents renders it absolutely necessary in many cases that a *home* for the minor should be found in a place different from that of the parents, and if the rule was applied, such children, for whose benefit the free schools were especially instituted, would be deprived of all benefit of them." *State* vs. *Thayer*, 74 Wis. 48.

I presume it is unnecessary for me to brief or even call passing attention to the fact that "compulsory education" laws cannot possibly apply to any child who could not, if refused admission to a school, force his entrance by mandamus. No compulsory attendance can be enforced in any case where tuition is an incident to the right of attendance. I believe this is too elementary a proposition to require argument. The labor forbidden and the compulsory attendance is the result of a joint act for a single purpose and necessarily applicable to *the same* individual.

The act, even to section 2, which stipulates as to employment of children under fifteen makes this plain.

The first proviso of section 2 is an exception of all provisions to certain children over twelve after an investigation of "a probation officer or attendance officer (educational) of the city or city and county in which such child resides" and "such certificate shall always be open to the inspection of the attendance and probation officers" "and provided that the attendance officer of any county, city and county or school district in which any place of employment in this section named is situated," etc. "provided, however, if such attendance or probation officer is denied admittance," etc. "And provided that any such child over the age of twelve may be employed at any of the occupations mentioned in this act *during the regular vacation of the public schools* of the city, county, or city and county in which the place of employment is situated," etc.

Section 3 is equally enlightening as it requires every "certificate to be open at all times to the inspection of the school attendance and probation officers," etc.

The act in this connection not only shows that it is in effect a part and parcel of the educational laws but that it was intended only to apply to the officers as well as children of the State of California.

"Age and school certificates can only be issued by a California superintendent of city or county schools or his deputy" * * "persons issuing such certificates have power to administer oaths" * * "No fee can be charged" * * "Satisfactory evidence under school census of the Compulsory Educational law is required" * * "County superintendents of schools shall file with the Commissioner of Labor a report showing the nummber of age and schooling certificates issued." * * "Any person issuing a false certificate is guilty of a misdemeanor." Clearest of all is the provision—"A duplicate copy of *each* age and schooling certificate *granted under this act* shall be kept by the person issuing such certificate, such copy to be *filed with the county superintendent of schools in the* county where the certificate is issued."

Can there be any question of the intent or effect of the act on this point? Can there be but one construction of a law making one provision while public schools are in session and another for vacation? Is it intended to act upon individuals who could not attend the public schools, to nonresidents who are not "wards of the state" and to whom the state's educational laws do not apply?

Every provision of the act relates exclusively to children coming under the jurisdiction and operation of the California school laws.

On still another point the California child labor law clearly shows that it is intended to apply only to children in the state who have no immediate intention of leaving—to children who would properly come under its school laws and are or at least are likely to become "wards of the state."

In section 2, immediately following the clause under which the right of nonresident children to participate in dramatic productions temporarily within the state is questioned, and following the clause first quoted, the act provides:

> "Provided, that the judge of the juvenile court of the county, or city and county, or in any county or city and county in which there is no juvenile court, then a judge of the superior court *of the county or city and county in which such child resides* * * may issue a permit to work to any such child over twelve years of age * * * after investigation by a probation officer or attendance officer of the *city* or *city and county in which such child resides*."

The provision as to residence is reiterated under section 3*a*, where any one who employs children under permit, during hours when the public schools are in session, within one week after the termination of such employment is required to notify "the judge of the juvenile court *in the county of said child's residence*, or the probation officer of such juvenile court," etc.

The courts of California have already defined the meaning of "residence" when used in a statute along similar lines. In the case of *Dow* vs. *Gould et al.*, 31 Cal. pp. 650-652, it is said:

> "The residence contemplated by the act by those who are married out of the State, is not a mere temporary or transient residence, but such a residence which as will fill the definition of the term 'domicil' which term is defined as 'the place where a person has fixed his ordinary dwelling without a present intention of removal.'"

The statute applying as it does to children who are residents of the state could not possibly affect such children as are but temporarily within the State, with a theatrical production, where neither the theatrical production nor the child will remain in the State, and the visit to the State is but an incident of a general tour.

There is a considerable element of doubt as to the power of a State to pass a law prohibiting the only available means of an education in any art, when such education may be obtained without mental, moral or physical injury to the child. All educational and labor laws are enacted under the police power of a State. All enactments under this must be reasonable and reasonably construed. It is no valid exercise of police power to forbid any legitimate education and under it the State may only use all reasonable means to afford the child an education or safeguard the child in obtaining an education. The stage child can only obtain its dramatic education through the training possible under participation in theatrical productions.

No state passes laws to raise moot questions or laws that are incapable of enforcement, and if a law may have two constructions, one legal and enforceable, the other incapable of enforcement, the former always prevails.

Section 4 provides:

> "Any person, firm, corporation, agent, or officer of a firm or corporation that violates or omits to comply with any of the foregoing provisions of this act, or that employs, or suffers or permits any minor to be employed in violation thereof, is guilty of a misdemeanor, and shall, upon conviction thereof, be punished by a fine of not less than fifty dollars or more than two hundred dollars, or by imprisonment for not more than sixty days, or by both such fine and imprisonment for each and every offense. A failure to produce any age and schooling certificate or permit," etc.

To begin with the children are nonresidents and cannot obtain school certificates, as these are only issuable by California officials to children residents of California, and therefore there can be no compliance with the act.

The penalty applies to "any firm, corporation, agent or officer of a firm or corporation that violates or omits to comply," etc.

This is a penal statute and must be strictly construed. No person can be convicted under it unless the statute admits of no reasonable construction other than that under which a conviction may be had.

Bear in mind that the theatrical companies coming into California are owned by nonresidents. The child is the child of nonresident parents. The nonresident owner, the child and the child's parents enter into a perfectly legal arrangement and the child goes on tour with the company. The child is not engaged to go to California but to play with the company, which may, as part of its tour, play in your State. The company owner does not go with the company. The manager of the company has nothing to do with employing the child nor retaining it in the company's employ. He could not engage it or dismiss it. He neither employs, permits or suffers the child to be employed, and is not concerned in the child's employment. All actors are supplied by the owner of the production, who alone can engage or replace them.

The nonresident owner does not come to the State. Furthermore, his engagement of the child, when made was perfectly legal and for a legitimate purpose. He, therefore, is guilty of no crime.

The company manager has not employed the child. He has no such authority. He neither employs nor suffers nor permits the employment of a minor. He has nothing to do with it. He does not book the play and has nothing to do with where it goes. He therefore commits no offense.

The child is not sent to any California factory or place of business, nor is there any intention of the child or company engaging in any fixed business in the State. The child is with the company to appear in the theatres on a general tour, in which California may or may not be an incident.

The house manager has no control over the company, or its members, nor does he have anything to do with the employment of the child.

Plays requiring children are not forbidden under the law. Theatres are not prohibited from booking plays having children. The performance is legal. The original employment of the child was likewise legal. No act forbidden by the law has been done in the State. No person specified in section 4, has entered the State. Where, then, has the penal statute any effect? Who has transgressed the laws of the State?

From all of the foregoing I respectfully suggest that there is no law now in force in California which would prohibit nonresident children traveling with foreign theatrical attractions from participating in legitimate dramatic productions in the State of California.

Very truly yours,

(Signed) LIGON JOHNSON,
General Counsel.

OPINION NO. 2350.

SAN FRANCISCO, CAL., September 13, 1912.

Hon. John P. McLaughlin, Commissioner, Bureau of Labor Statistics, San Francisco, Cal.

DEAR SIR: I have your letter of July 27th, enclosing correspondence between your office and the A. K. Brauer Company of Los Angeles, wherein you have taken the position that the so-called Women's Eight Hour Law applies to all women employed by a corporation, and that the fact that a woman is either a stockholder or director of a corporation does not relieve the corporation from the provisions of the law.

You ask me to advise you whether your office has made the correct interpretation of the law in this respect.

The provisions of the act of March 22, 1911 (Stats. 1911, p. 437), commonly known as the Women's Eight Hour Law, prohibit the employment of any female in any manufacturing or mercantile establishment, etc. It is to be noted that the provisions of the law go to the question of the employment of females and the penalties are attached to the employer violating the provisions of the law.

An employee has been commonly defined as "one who works for an employer, a person working for a salary or wage."

> "The word is applied to any one so working, but usually only to clerks, workmen, laborers, etc., and but rarely to the higher officers of the government or corporation." *Palmer* vs. *VanFantvoord,* 47 N. E., 915.

Also:

> "An employee is a person who is employed; one who works for wages or a salary." *In re Cortland Mfg. Co.,* 45 N. Y. Sup. 630.

Under the provisions of the bankruptcy law, a director of a corporation is not entitled to the preferences for wages as an employee, and in the interpretation of this law, it has been frequently held that a managing director or superintendent is not an employee of the corporation. But the purposes of this law depend solely upon the public policy, which aims to prevent fraud upon the creditors of a corporation, where the directors, for the purpose of consuming the assets of the corporation, attempt to pay themselves exorbitant salaries as employees of the corporation.

Though under the provisions of the bankruptcy law and its interpretations, a director of a corporation is not, therefore, strictly speaking an employee of the corporation, I am of the opinion that this rule should not be followed in the interpretation of the eight hour law.

The term "employ" carries with it the idea and almost the essence of a contract. Therefore, when a corporation engages any of its stockholders or directors for any services on behalf of the corporation, for which they are paid a salary or wages, the corporation then employs such person, and it is immaterial whether the person so employed is considered strictly an employee or an officer of the corporation. When a director of a corporation performs duties outside of the natural duties of the Board of Directors, such person, whether engaged as a mere laborer, clerk or agent, or engaged as a superintendent or manager, is nevertheless employed by the corporation.

It can make no difference, therefore, as far as the provisions of this statute are concerned, whether a stockholder or director of a corporation is an officer or employee of the corporation. If she is employed by the corporation and paid a salary or wages by it, the corporation then comes within the provisions of the statute, and all of its restrictions become applicable to such employment.

Very truly yours,

U. S. WEBB, Attorney General.
By JOHN T. NOURSE, Deputy.

OPINION NO. 2383.

SAN FRANCISCO, October 26, 1912.

Hon. John P. McLaughlin, Commissioner, Bureau of Labor Statistics, San Francisco, Cal.

DEAR SIR: This office is in receipt of your communication of October 1, 1912, reading as follows:

> "On April 29th, 1912, I wrote to the various departments of the city and county of San Francisco, calling their attention to a violation of Stats. of 1893, page 54, providing for a weekly day of rest.
>
> I am enclosing herewith copy of an opinion rendered by the city attorney, together with correspondence and other data. You will notice that the city attorney—in his opinion—uses the term 'laborer,' whereas the language of the Act is far more comprehensive and reads, 'every person employed in any occupation of labor.' The city attorney also quotes provisions of the charter of the city and county of San Francisco, subdivision 24 of section 1, chap. 2, article 2, and chap. 3, article 2, which fixes the hours of service required of all laborers. Section 653 of the Penal Code covers a wider scope and provides that 'the time of service of any laborer, workman, or mechanic, employed upon any of the public works of the State of California, or of any political subdivision thereof . . . is limited and restricted to eight hours during any one calendar day.'
>
> I, therefore, submit for your opinion the following questions:
>
> (1) Does the language of Statutes of 1893, page 54, 'Every person employed in any occupation of labor' include all the employees in the various departments of a municipal corporation?

(2) Does the charter of the city and county of San Francisco take precedence over an act of the legislature?

(3) Is a municipal corporation amenable, and does it come under the provisions of Statutes of 1893, page 54?"

Accompanying your communication are several documents [illegible] which relate to the application of the act of 1893 with respect to the [illegible] and county of San Francisco and the various departments thereof. [illegible] am led to believe, therefore, that your communication is made with reference principally to the application of this statute to that city and county and as your questions are directed solely to the statute of 1893 I shall, in this opinion, confine my answers to your questions to the application of that statute to the city and county of San Francisco. If you desire the further opinion of this office with relation to its application to other municipal corporations I shall, of course, be pleased to render such opinion with respect to any particular corporation you may have in mind upon receiving your request therefor accompanied by any data you have to furnish.

(1) In answer to your first question let me direct your attention to the act of February 27, 1893 (Stats. 1893, p. 54), which provides as follows:

"SECTION 1. Every person employed in any occupation of labor shall be entitled to one day's rest therefrom in seven; and it shall be unlawful for any employer of labor to cause his employees, or any of them, to work more than six days in seven; *provided, however,* that the provisions of this section shall not apply to any case of emergency.

SEC. 2. For the purpose of this act, the term day's rest shall mean and apply to all cases, whether the employee is engaged by the day, week, month, or year, and whether the work performed is done in the day or night time.

SEC. 3 Any person violating the provisions of this act shall be deemed guilty of a midemeanor.

SEC. 4. This act shall take effect and be in force thirty days from and after its passage."

It will be noticed that the only penalty imposed by the act for a violation of its provisions is that any person violating such provisions shall be deemed guilty of a misdemeanor.

The punishment provided by law in cases of misdemeanors is either imprisonment or fines or both. Obviously a municipal corporation cannot be imprisoned. Admitting that there may be instances in which this municipality may be proceeded against under the provisions of chapter IX, title X, part II of the Penal Code and a fine be imposed upon and collected from it for the violation of the statute, in the same manner that a fine could be imposed upon and collected from a private person or corporation, such procedure would be fruitless and without results for the reason that only a fine could be imposed after conviction on a prosecution of the city and county of San Francisco for the violation of the provisions of a statute when such violation constitutes merely a misdemeanor, as it does under this statute, and the fine if collected would be immediately paid into the treasury of the city and county for its use, under the provisions of section 1457 and 1570 of the Penal Code.

In view of this fact I am of the opinion that the language of the act of February 27, 1893, can not extend to the city and county of San Francisco as an employer. Nor does the language of that act include the employees in the various departments of that municipal corporation, for they are employees of the municipal corporation. In other words the department, officer, or foreman, who as employing agent engages the employee and directs him in the performance of his work, is not his employer but merely his superior in authority. His employment is sanctioned by the municipal corporation and it is to that body alone that he must look for his pay. It is the municipal corporation alone that is to be regarded as the employer, and so regarded it is not to be deemed included within the terms of the act.

(2) In answer to your second question I have to advise you that under section 6 of article XI of the Constitution of the State of California, the charter of the city and county of San Francisco, except in municipal affairs, is subject to and controlled by an act of the legislature. Here, however, the act of the legislature, viz., the act of February 27, 1893, is inapplicable to the city and county of San Francisco and therefore no conflict arises and there is no necessity for discussing the question as to whether the charter of the city and county of San Francisco is subject to or controlled by such act.

(3) Your third question I have answered in my discussion of your first question.

Very truly yours,

U. S. WEBB, Attorney General.
By Robert W. Harrison, Deputy.

PART TWO.

STATISTICAL TABLES.

HOURS OF LABOR AND WAGES.

Tables I to VI—San Francisco.

In the investigation of hours of labor and wages paid in San Francisco, data was secured covering a total of 60,166 individuals. The establishments in which these individuals were employed were classified, according to their character, as manufacturing establishments, wholesale establishments, retail establishments, and miscellaneous establishments.

Manufacturing Establishments.

Data secured from manufacturing establishments covered 36,912 employees, 28,170, or 76.3 per cent of whom were males, and 8,742, or 23.7 per cent were females. Male employees: Of the 28,170 male employees, 188, or 0.7 per cent, worked less than 8 hours per day; 15,265, or 54.1 per cent, worked 8 hours; 9, 131, or 32.4 per cent, worked 9 hours; 2,778, or 9.9 per cent, worked 10 hours; 219, or 0.8 per cent, worked 11 hours; and 589, or 2.1 per cent, worked 12 hours and over. The wages received per week were classified in groups ranging from less than $3 to $25 and over. 1.0 per cent received less than $6; 4.9 per cent received from $6 to $8.99; 8.2 per cent received from $9 to $11.99; 14.1 per cent received from $12 to $14.99; 14.6 per cent received from $15 to $17.99; 12.9 per cent received from $18 to $20.99; 20.0 per cent received from $21 to $24.99; and 24.3 per cent received $25 and over. Of the total number considered, 71.8 per cent received $15 or over per week. Female employees: The hours of labor of female employees were eight or under, strict compliance with the eight-hour law for women having been enforced by this Bureau. Of the 8,742 females employed in manufacturing establishments, 8,551, or 97.8 per cent, worked 8 hours per day; and the remaining 191, or 2.2 per cent, worked less than 8 hours. The wages paid per week were classified in groups ranging from less than $3, to $25 and over. 0.1 per cent received less than $3; 6.4 per cent received from $3 to $5.99; 33.6 per cent received from $6 to $8.99; 29.8 per cent received from $9 to $11.99; 15.7 per cent received from $12 to $14.99; 7.6 per cent received from $15 to $17.99; 3.8 per cent received from $18 to $20.99; 1.3 per cent received from $21 to $24.99; and 1.7 per cent received $25 and over. Of the total number of female employees considered, 60.1 per cent received $9 or over per week.

Wholesale Establishments.

Data secured from wholesale establishments covered 10,397 individuals, 8,300, or 79.8 per cent of whom were males, and 2,097, or 20.2

per cent were females. Male employees: Of the 8,300 male employees, 27, or 0.3 per cent, worked less than 8 hours per day; 3,254, or 39.2 per cent, worked 8 hours; 4,149, or 50.0 per cent, worked 9 hours; 840, or 10.1 per cent, worked 10 hours; and 29, or 0.4 per cent, worked 11 hours or over. The wages received per week were classified in groups ranging from less than $3, to $25 and over. 1.1 per cent received less than $6; 5.4 per cent received from $6 to $8.99; 6.6 per cent received from $9 to $11.99; 9.3 per cent received from $12 to $14.99; 16.5 per cent received from $15 to $17.99; 13.0 per cent received from $18 to $20.99; 9.6 per cent received from $21 to $24.99; and 38.5 per cent received $25 and over. Of the total number considered, 77.6 per cent received $15 or over per week. Female employees: 64, or 3.1 per cent of the 2,097 female employees, worked less than 8 hours per day, and the remaining 2,033, or 96.9 per cent, worked 8 hours, longer hours of employment being prohibited by statute. The wages received per week, according to the classification arranged, were as follows: 3.0 per cent received less than $6; 21.8 per cent received from $6 to $8.99; 19.9 per cent received from $9 to $11.99; 19.3 per cent received from $12 to $14.99; 19.0 per cent received from $15 to $17.99; 8.9 per cent received from $18 to $20.99; 4.4 per cent received from $21 to $24.99; 3.7 per cent received $25 and over. Of the total number of female employees considered, 75.2 per cent received $9 or over per week.

Retail Establishments.

Data secured from retail establishments covered 10,249 individuals, 5,389, or 52.6 per cent of whom were males, and 4,860, or 47.4 per cent were females. Male employees: Daily hours of labor for male employees were as follows: for 55, or 1.0 per cent, less than 8 hours; for 1,937, or 35.9 per cent, 8 hours; for 3,081, or 57.2 per cent, 9 hours; for 300, or 5.6 per cent, 10 hours; and for 16, or 0.3 per cent, 11 hours or over. The wages received per week were classified in groups ranging from less than $3, to $25 and over. 0.1 per cent received less than $3; 3.6 per cent received from $3 to $5.99; 10.1 per cent received from $6 to $8.99; 6.5 per cent received from $9 to $11.99; 8.1 per cent received from $12 to $14.99; 14.7 per cent received from $15 to $17.99; 12.5 per cent received from $18 to $20.99; 12.5 per cent received from $21 to $24.99; and 31.9 per cent received $25 and over. Of the total number considered, 71. 6 per cent received $15 or over per week. Female employees: Practically all of the 4,860 female employees worked 8 hours per day, but 36, or 0.7 per cent, worked less than 8 hours, and the remaining 4,824, or 99.3 per cent, worked the 8-hour maximum allowed by the state law. The wages received per week were as follows: 1.1 per cent received less than $3; 9.3 per cent received from $3 to $5.99; 20.0 per cent received from $6 to $8.99; 20.9 per cent received from $9 to $11.99; 23.5 per cent received from $12 to $14.99; 11.8 per cent received from $15 to $17.99; 5.7 per cent received from $18 to $20.99; 4.0 per cent received from $21 to $24.99; 3.7 per cent received $25 and over. Of the total number of female employees considered, 69.6 per cent received $9 or over per week.

Miscellaneous Establishments.

A record of 2,608 individuals was obtained in the investigation of miscellaneous establishments. Of these, 2,220, or 85.1 per cent were males, and 388, or 14.9 per cent were females. Male employees: 181, or 8.1 per cent of the male employees, worked less than 8 hours per day; 526, or 23.7 per cent, worked 8 hours; 516, or 23.2 per cent, worked 9 hours; 939, or 42.3 per cent, worked 10 hours; 30, or 1.4 per cent, worked 11 hours; and 28, or 1.3 per cent, worked 12 hours and over. The wages received per week were as follows: 0.3 per cent received less than $6; 1.6 per cent received from $6 to $8.99; 2.5 per cent received from $9 to $11.99; 4.6 per cent received from $12 to $14.99; 15.6 per cent received from $15 to $17.99; 26.0 per cent received from $18 to $20.99; 24.7 per cent received from $21 to $24.99; 24.7 per cent received $25 and over. Of the total number considered, 91.0 per cent received $15 or over per week. Female employees: 159, or 41.0 per cent of the 388 female employees, worked less than 8 hours per day, and the remaining 229, or 59.0 per cent, worked the 8-hour maximum allowed by the state law. The wages received per week were as follows: 19.6 per cent received from $6 to $8.99; 20.1 per cent received from $9 to $11.99; 13.9 per cent received from $12 to $14.99; 18.8 per cent received from $15 to $17.99; 14.2 per cent received from $18 to $20.99; 6.2 per cent received from $21 to $24.99; and 7.2 per cent received $25 and over. Of the total number of female employees considered, 80.4 per cent received $9 or over per week.

All Establishments.

Of the total of 60,166 individuals, concerning whom data was secured in the investigation in San Francisco, 44,079, or 73.3 per cent were males, and 16,087, or 26.7 per cent were females. Male employees: Of the male employees, 451, or 1.0 per cent, worked less than 8 hours per day; 20,982, or 60.9 per cent, worked 8 hours; 16, 877, or 38.3 per cent, worked 9 hours; 4,857, or 11.0 per cent, worked 10 hours; 258, or 0.6 per cent, worked 11 hours; and 654, or 1.5 per cent. worked 12 hours. The wages received were classified in groups ranging from less than $3, to $25 and over per week. 1.3 per cent received less than $6; 5.5 per cent received from $6 to $8.99; 7.4 per cent received from $9 to $11.99; 12.0 per cent received from $12 to $14.99; 15.0 per cent received from $15 to $17.99; 13.5 per cent received from $18 to $20.99; 17.3 per cent received from $21 to $24.99 and 28.0 per cent received $25 and over. Of the total number considered, 73.8 per cent received $15 or over per week. Female employees: The hours of labor of female employees were limited to 8 hours or under per day, strict compliance with the eight hour law for women having been enforced by this

Bureau. Of the total of 16,087 female employees, concerning whom data was secured in San Francisco, 15,637, or 97.2 per cent, worked 8 hours per day, and the remaining 450, or 2.8 per cent, worked less than 8 hours. The wages received were classified in groups ranging from less than $3, to $25 and over, per week. 0.4 per cent received less than $3; 6.7 per cent received from $3 to $5.99; 27.6 per cent received from $6 to $8.99; 25.6 per cent received from $9 to $11.99; 18.5 per cent received from $12 to $14.99; 10.6 per cent received from $15 to $17.99; 5.3 per cent received from $18 to $20.99; 2.6 per cent received from $21 to $24.99; and 2.7 per cent received $25 and over. Of the total number of female employees considered in all establishments in San Francisco, 66.3 per cent received $9 or over per week.

Tables VII to XII—Los Angeles.

In the investigation of hours of labor and wages paid in Los Angeles, data was secured covering a total of 48,361 individuals. The establishments, in which these individuals were employed, were classified according to their character; as manufacturing, wholesale, retail and miscellaneous establishments.

Manufacturing Establishments.

Data secured from manufacturing establishments covered 29,125 employees, of whom 23,521, or 80.8 per cent, were males and 5,604, or 19.2 per cent, females. Male employees: Of the 23,521 males, 246, or 1.0 per cent, worked less than 8 hours per day; 6,355, or 27.0 per cent, 8 hours; 12,064, or 51.4 per cent, 9 hours; 4,230, or 18.0 per cent, 10 hours; 291, or 1.2 per cent, 11 hours; and 335, or 1.4 per cent, 12 hours. The wages per week were classified in groups ranging from less than $3, to $25 and over. 0.1 per cent received less than $3; 1.1 per cent from $3 to $5.99; 6.4 per cent from $6 to $8.99; 9.9 per cent from $9 to $11.99; 19.6 per cent from $12 to $14.99; 17.1 per cent from $15 to $17.99; 17.2 per cent from $18 to $20.99; 12.7 per cent from $21 to $24.99; and 15.9 per cent $25 and over. Of the total number considered, 62.9 per cent received $15 or over per week.

Female employees: The hours of labor for females were 8 hours or less per day, strict compliance with the 8 hour law for women having been enforced by this Bureau. Of the 5,604 females employed in manufacturing establishments, 5,551, or 99.1 per cent, worked 8 hours and the remaining 53, or 0.9 per cent, less than 8 hours. The wages per week were classified in groups ranging from less than $3, to $25 and over. 0.3 per cent received less than $3; 7.9 per cent from $3 to $5.99; 39.5 per cent from $6 to $8.99; 26.9 per cent from $9 to $11.99; 14.0 per cent from $12 to $14.99; 6.7 per cent from $15 to $17.99; 3.0 per cent from $18 to $20.99; 0.6 per cent from $21 to $24.99; and 1.1 per cent $25 and over. Of the total number considered, 52.3 per cent received $9 or over per week.

Wholesale Establishments.

Data secured from wholesale establishments covered 5,638 employees, of whom 4,820, or 85.5 per cent, were males and 818, or 14.5 per cent, females. Male employees: Of the 4,820 males, 6, or 0.1 per cent, worked less than 8 hours per day; 1,536, or 31.9 per cent, 8 hours; 2,617, or 54.3 per cent, 9 hours; 613, or 12.7 per cent, 10 hours; 18, or 0.4 per cent, 11 hours; and 30, or 0.6 per cent, 12 hours and over. The wages per week were classified in groups ranging from less than $6, to $25 and over. 0.3 per cent received less than $6; 5.2 per cent from $6 to $8.99; 5.5 per cent from $9 to $11.99; 18.5 per cent from $12 to 14.99; 21.7 per cent from $15 to $17.99; 13.2 per cent from $18 to $20.99; 7.0 per cent from $21 to $24.99; and 28.6 per cent $25 and over. Of the total number considered, 70.5 per cent received $15 or over per week.

Female employees: The hours of labor for females were 8 hours or less per day, strict compliance with the eight hour law for women having been enforced by this Bureau. Of the 818 females employed in wholesale establishments, 814, or 99.5 per cent, worked 8 hours and the remaining 4, or 0.5 per cent, less than 8 hours. The wages per week were classified in groups ranging from $3, to $25 and over. 2.6 per cent received from $3 to $5.99; 15.2 per cent from $6 to $8.99; 18.3 per cent from $9 to $11.99; 22.4 per cent from $12 to $14.99; 23.5 per cent from $15 to $17.99; 11.2 per cent from $18 to $20.99; 3.4 per cent from $21 to $24.99; and 3.4 per cent $25 and over. Of the total number considered, 82.2 per cent received $9 or over per week.

Retail Establishments.

Data received from retail establishments covered 11,604 employees, of whom 6,277, or 54.1 per cent, were males and 5,327, or 45.9 per cent, females. Male employees: Of the 6,277 males, 44, or 0.7 per cent, worked less than 8 hours; 1,167, or 18.6 per cent, 8 hours; 3,553, or 56.6 per cent, 9 hours; 1,320, or 21.0 per cent, 10 hours; 162, or 2.6 per cent, 11 hours; and 31, or 0.5 per cent, 12 hours and over. The wages per week were classified in groups ranging from less than $3, to $25 and over. 0.1 per cent received less than $3; 2.5 per cent from $3 to $5.99; 7.4 per cent from $6 to $8.99; 9.6 per cent from $9 to $11.99; 17.0 per cent from $12 to $14.99; 18.8 per cent from $15 to $17.99; 15.6 per cent from $18 to $20.99; 9.4 per cent from $21 to $24.99; and 19.6 per cent, $25 and over. Of the total number considered, 63.4 per cent received $15 or over per week.

Female employees: The hours of labor for females were 8 hours or less per day, strict compliance with the eight hour law for women having been enforced by this Bureau. Of the 5,327 females employed in retail establishments, 5,257, or 98.7 per cent, worked 8 hours and the remaining 70, or 1.3 per cent, less than 8 hours. The wages per week were classified in groups ranging from less than $3, to $25 and over. 0.3 per cent received less than $3; 12.6 per cent from $3 to $5.99; 25.9

per cent from $6 to $8.99; 25.9 per cent from $9 to $11.99; 16.5 per cent from $12 to $14.99; 10.5 per cent from $15 to $17.99; 5.1 per cent from $18 to $20.99; 0.9 per cent from $21 to $24.99; and 2.3 per cent $25 and over. Of the total number considered, 71.2 per cent received $9 or over per week.

Miscellaneous Establishments.

Data secured from miscellaneous establishments covered 1,994 employees, of whom 1,832, or 91.9 per cent, were males and 162, or 8.1 per cent, females. Male employees: Of the 1,832 males 475, or 25.9 per cent, worked 8 hours or less; 578, or 31.6 per cent, 9 hours; 738, or 40.3 per cent 10 hours; and 41, or 2.2 per cent, 11 hours and over. The wages per week were classified in groups ranging from less than $3, to $25 and over. 1.2 per cent received less than $3; 0.1 from $3 to $5.99; 1.0 per cent from $6 to $8.99; 3.1 per cent from $9 to $11.99; 23.7 per cent from $12 to $14.99; 37.6 per cent from $15 to $17.99; 14.1 per cent from $18 to $20.99; 6.3 per cent from $21 to $24.99; and 12.9 per cent $25 and over. Of the total number considered, 70.9 per cent received $15 or over per week.

Female employees: The hours of labor for females were 8 hours or less per day, strict compliance with the eight hour law for women having been enforced by this Bureau. Of the 162 females employed in miscellaneous establishments, 141, or 87.0 per cent, worked 8 hours and the remaining 21, or 13.0 per cent, less than 8 hours. The wages per week were classified in groups ranging from $6 to $25 and over. 15.4 per cent received from $6 to $8.99; 19.8 per cent from $9 to $11.99; 27.2 per cent from $12 to $14.99; 21.0 per cent from $15 to $17.99; 8.0 per cent from $18 to $20.99; 4.9 per cent from $21 to $24.99; and 3.7 per cent $25 and over. Of the total number considered, 84.6 per cent received $9 or over per week.

All Establishments.

Of the total of 48,361 individuals, concerning whom data was secured in the investigation in Los Angeles, 36,450, or 75.4 per cent, were males and 11,911, or 24.6 per cent, females. Male employees: Of the 36,450 males, 297, or 0.8 per cent, worked less than 8 hours; 9,532, or 26.2 per cent, 8 hours; 18,812, or 51.6 per cent, 9 hours; 6,901, or 18.9 per cent, 10 hours; 472, or 1.3 per cent, 11 hours; and 436, or 1.2 per cent, 12 hours and over. The wages per week were classified in groups ranging from less than $3, to $25 and over. 0.1 per cent received less than $3; 1.2 per cent from $3 to $5.99; 6.2 per cent from $6 to $8.99; 9.0 per cent from $9 to $11.99; 19.2 per cent from $12 to $14.99; 19.0 per cent from $15 to $17.99; 16.2 per cent from $18 to $20.99; 11.0 per cent from $21 to $24.99; and 18.1 per cent $25 and over. Of the total number considered, 64.3 per cent received $15 and over per week.

Female employees: The hours of labor of female employees were limited to 8 hours or less per day, strict compliance with the eight hour law for women having been enforced by this Bureau. Of the total of 11,911 females, concerning whom data was secured in Los Angeles, 11,763, or 98.8 per cent, worked 8 hours and the remaining 148, or 1.2 per cent, less than 8 hours. The wages received were classified in groups ranging from less than $3, to $25 and over per week. 0.3 per cent received less than $3; 9.5 per cent from $3 to $5.99; 31.4 per cent from $6 to $8.99; 25.8 per cent from $9 to $11.99; 15.9 per cent from $12 to $14.99; 9.7 per cent from $15 to $17.99; 4.6 per cent from $18 to $20.99; 1.0 per cent from $21 to $24.99; and 1.8 per cent $25 and over. Of the total number considered, 58.8 per cent received $9 or over per week.

Tables XIII to XVIII—Oakland.

In the investigation of hours of labor and wages paid in Oakland, data was secured covering a total of 9,777 individuals. Of this number, 6,934, or 70.9 per cent, were males, and 2,834, or 29.1 per cent, were females.

Male employees: 111, or 1.6 per cent, of the male employees, worked less than 8 hours per day; 3,042, or 43.9 per cent, worked 8 hours; 2,657, or 38.3 per cent, worked 9 hours; 1,059, or 15.3 per cent, worked 10 hours; and 65, or 0.9 per cent, worked 11 hours or over. The wages paid were classified in groups ranging from less than $3, to $25 and over, per week. 0.1 per cent received less than $3; 2.5 per cent received from $3 to $5.99; 4.8 per cent received from $6 to $8.99; 8.4 per cent received from $9 to $11.99; 10.1 per cent received from $12 to $14.99; 16.6 per cent received from $15 to $17.99; 17.0 per cent received from $18 to $20.99; 18.6 per cent received from $21 to $24.99; and 21.9 per cent received $25 and over. Of the total number considered, 74.1 per cent received $15 or over per week.

Female employees: The daily hours of labor of female employees were limited to 8 hours or under per day, strict compliance with the eight-hour law for women having been enforced by this Bureau. Of the total of 2,843 female employees, concerning whom data was secured in Oakland, 2,785, or 98.0 per cent, worked 8 hours per day, and the remaining 58, or 2.0 per cent, worked less than 8 hours. The wages paid were classified in groups ranging from less than $3, to $25 and over, per week. 11.4 per cent received less than $6; 41.4 per cent received from $6 to $8.99; 21.9 per cent received from $9 to $11.99; 12.3 per cent received from $12 to $14.99; 6.5 per cent received from $15 to $17.99; 3.5 per cent received from $18 to $20.99; 1.3 per cent received from $21 to $24.99; 1.7 per cent received $25 and over. Of the total number considered, 47.2 per cent received $9 or over per week.

Tables XIX to XXIV—Sacramento.

In the investigation of hours of labor and wages paid in Sacramento, data was secured covering a total of 4,662 individuals. Of this number 3,327, or 71.4 per cent, were males, and 1,335, or 28.6 per cent, were females. Male employees: 19, or 0.6 per cent of the male employees, worked less than 8 hours per day; 1,655, or 49.8 per cent, worked 8 hours; 1,086, or 32.6 per cent, worked 9 hours per day; 512, or 15.4 per cent, worked 10 hours; 37, or 1.1 per cent, worked 11 hours; and 18, or 0.5 per cent, worked 12 hours. The wages paid were classified in groups ranging from less than $3, to $25 and over per week; 0.3 per cent received less than $3; 2.2 per cent received from $3 to $5.99; 5.1 per cent received from $6 to $8.99; 5.8 per cent received from $9 to $11.99; 9.2 per cent received from $12 to $14.99; 18.1 per cent received from $15 to $17.99; 17.8 per cent received from $18 to $20.99; 15.4 per cent received from $21 to $24.99; and 26.1 per cent received $25 and over. Of the total number considered 77.4 per cent received $15 or over per week. Female employees: The hours of labor of female employees were limited to 8, or under, per day, strict compliance with the eight-hour law for women being required by this Bureau. The wages paid were classified in groups, ranging from less than $3 to $25 and over per week. 1.7 per cent received less than $3; 16.0 per cent received from $3 to $5.99; 30.3 per cent received from $6 to $8.99; 25.4 per cent received from $9 to $11.99; 11.0 per cent received from $12 to $14.99; 7.9 per cent received from $15 to $17.99; 3.3 per cent received from $18 to $20.99; 1.7 per cent received from $21 to $24.99; 2.7 per cent received $25 and over. Of the total number considered, 52.0 per cent received $9 or over per week.

Tables XXV to XXX—San José.

In the investigation of hours of labor and wages paid in San José, data was secured covering a total of 1,862 individuals. Of this number 1,308, or 70.2 per cent, were males, and 554, or 29.8 per cent, were females. Male employees: 23, or 1.8 per cent of the male employees, worked less than 8 hours per day; 525, or 40.1 per cent, worked 8 hours; 418, or 32.0 per cent, worked 9 hours; 305, or 23.3 per cent, worked 10 hours; 7, or 0.5 per cent, worked 11 hours; and 30, or 2.3 per cent, worked 12 hours or over. The wages paid were classified in groups ranging from less than $3 to $25 and over per week. 1.7 per cent received less than $3; 1.8 per cent received from $3 to $5.99; 4.9 per cent received from $6 to $8.99; 5.7 per cent received from $9 to $11.99; 13.1 per cent received from $12 to $14.99; 16.7 per cent received from $15 to $17.99; 19.0 per cent received from $18 to $20.99; 13.4 per cent received from $21 to $24.99; 23.7 per cent received $25 and over. Of the total number considered, 72.8 per cent received $15 or over per week. Female employees: The hours of labor of female employees were limited to 8 or under per day, strict compliance with the eight hour law for women having been required by this Bureau. Of the total 554 female employees, concerning whom data was secured in San José, 546, or 98.6 per cent, worked 8 hours per day, and the remaining 8, or 1.4 per cent, worked less than 8 hours. The wages paid were classified in groups ranging from less than $3 to $25 and over per week. 2.3 per cent received less than $6; 34.5 per cent received from $6 to $8.99; 33.4 per cent received from $9 to $11.99; 18.1 per cent received from $12 to $14.99; 5.8 per cent received from $15 to $17.99; 3.2 per cent received from $18 to $20.99; 1.1 per cent received from $21 to $24.99; 1.6 per cent received $25 and over. Of the total number considered, 63.2 per cent received $9 or over per week.

Tables XXXI to XXXVI—Stockton.

In the investigation of hours of labor and wages paid in Stockton, data was secured covering 2,606 individuals. Of this number, 2,079, or 79.8 per cent, were males, and 527, or 20.2 per cent, were females. Male Employees: 13, or 0.6 per cent, of the male employees, worked less than 8 hours per day; 587, or 28.2 per cent, worked 8 hours; 1,095, or 52.7 per cent, worked 9 hours; 350, or 16.8 per cent, worked 10 hours; 24, or 1.2 per cent, worked 11 hours; 10, or 0.5 per cent, worked 12 hours or over. The wages paid were classified in groups ranging from less than $3 to $25 and over per week. 0.1 per cent received less than $3; 1.6 per cent received from $3 to $5.99; 4.5 per cent received from $6 to $8.99; 6.6 per cent received from $9 to $11.99; 13.0 per cent received from $12 to $14.99; 15.6 per cent received from $15 to $17.99; 21.0 per cent received from $18 to $20.99; 20.6 per cent received from $21 to $24.99; 17.0 per cent received $25 and over. Of the total number considered 74.2 per cent received $15 or over per week. Female Employees: The daily hours of labor of female employees were limited to 8 or under per day, strict compliance with the eight hour law for women having been required by this Bureau. Of the total of 527 female employees, concerning whom data was secured in Stockton, 518, or 98.3 per cent, worked 8 hours per day, and the remaining 9, or 1.7 per cent, worked less than 8 hours. The wages paid were classified in groups ranging from less than $3 to $25 and over per week. 1.5 per cent received less than $3; 3.2 per cent received from $3 to $5.99; 30.0 per cent received from $6 to $8.99; 28.1 per cent received from $9 to $11.99; 16.9 per cent received from $12 to $14.99; 11.2 per cent received from $15 to $17.99; 5.9 per cent received from $18 to $20.99; 0.6 per cent received from $21 to $24.99; 2.6 per cent received $25 and over. Of the total number considered 65.3 per cent received $9 or over per week.

Tables XXXVII to XLII—San Diego.

In the investigation of hours of labor and wages paid in San Diego, data was secured covering a total of 3,702 individuals. Of this number 2,626, or 70.9 per cent, were males, and 1,076, or 29.1 per cent, were females. Male employees: 12, or 0.5 per cent, of the male employees, worked less than 8 hours per day; 749, or 28.5 per cent, worked 8 hours; 1,214, or 46.2 per cent, worked 9 hours; 633, or 24.1 per cent, worked 10 hours; 8, or 0.3 per cent, worked 11 hours; 10, or 0.4 per cent, worked

12 hours and over. The wages paid were classified in groups ranging from less than $3 to $25 and over per week. 0.4 per cent received less than $3; 2.2 per cent received from $3 to $5.99; 4.6 per cent received from $6 to $8.99; 8.5 per cent received from $9 to $11.99; 9.5 per cent received from $12 to $14.99; 27.1 per cent received from $15 to $17.99; 20.4 per cent received from $18 to $20.99; 12.3 per cent received from $21 to $24.99; 15.0 per cent received $25 and over. Of the total number considered 74.8 per cent received $15 and over per week. Female employees: The daily hours of labor of female employees were limited to 8 hours or under per day, strict compliance with the eight hour law for women being required by this Bureau. Of the total of 1,076 female employees, concerning whom data was secured in San Diego, 1,029, or 95.6 per cent, worked 8 hours per day, and the remaining 47, or 4.4 per cent, worked less than 8 hours. The wages paid were classified in groups ranging from less than $3 to $25 and over per week. 1.4 per cent received less than $3; 7.2 per cent received from $3 to $5.99; 41.3 per cent received from $6 to $8.99; 18.9 per cent received from $9 to $11.99; 16.0 per cent received from $12 to $14.99; 9.8 per cent received from $15 to $17.99; 3.0 per cent received from $18 to $20.99; 0.6 per cent received from $21 to $24.99; 1.8 per cent received $25 and over. Of the total number considered, 50.1 per cent received $9 or over per week.

Table XLIX—Summary for State.

Data was secured covering 145,154 individuals, in the investigation of hours of labor and wages paid throughout the State. Of this number 107,950, or 74.4 per cent, were males, and 37,204, or 25.6 per cent, were females. Male employees: 1,051, or 1.0 per cent, of the male employees worked less than 8 hours per day; 39,532, or 36.6 per cent, worked 8 hours; 46,627, or 43.2 per cent, worked 9 hours; 18,115, or 16.8 per cent, worked 10 hours; 950, or 0.9 per cent, worked 11 hours; and 1,675, or 1.5 per cent, worked 12 hours. The wages paid were classified in groups ranging from less than $3, to $25 and over, per week. 0.1 per cent received less than $3; 1.4 per cent received from $3 to $5.99; 5.3 per cent received from $6 to $8.99; 7.8 per cent received from $12 to $14.99; 17.8 per cent received from $15 to $17.99; 15.3 per cent received from $18 to $20.99; 14.8 per cent received from $21 to $24.99; 22.2 per cent received $25 and over. Of the total number considered, 70.1 per cent received $15 or over per week.

Female employees: The hours of labor of female employees were limited to 8 or under per day, strict compliance with the eight-hour law for women, being required by this Bureau. Of the total of 37,204 female employees, concerning whom data was secured throughout the state, 36,362, or 97.7 per cent, worked 8 hours per day, and the remaining 842, or 2.3 per cent, worked less than 8 hours. The wages paid were classified in groups ranging from less than $3, to $25 and over, per week. 0.4 per cent received less than $3; 8.1 per cent received from $3 to $5.99; 31.3 per cent received from $6 to $8.99; 25.7 per cent received from $9 to $11.99; 16.4 per cent received from $12 to $14.99; 9.6 per cent received from $15 to $17.99; 4.6 per cent received from $18 to $20.99; 1.7 per cent received from $21 to $24.99; 2.2 per cent received $25 and over. Of the total number considered, 60.2 per cent received $9 or over per week.

INSPECTION OF FACTORIES AND STORES.

Table I.

In the city of San Francisco, 1,998 establishments were inspected. Under the head of ''Manufacturing'' there were inspected 1,131 establishments, employing a total of 36,842 persons, of whom 28,071, or 76.2 per cent, were males; and 8,771, or 23.8 per cent, were females. Minors under the age of eighteen years constituted 4.1 per cent of the total number of employees, while minors under sixteen years of age constituted 0.7 per cent. Under the head of ''Wholesale'' there were inspected 336 establishments, employing a total of 10,566 persons, of whom 8,169, or 79.4 per cent, were males, and 2,121, or 20.6 per cent, were females. Minors under the age of eighteen constituted 4.6 per cent of the total number of employees, while minors under sixteen years of age constituted 0.6 per cent. Under the head of ''Retail'' there were inspected 336 establishments, employing a total of 10,566 per sons, of whom 5,955, or 56.4 per cent, were males, and 4,611, or 43.6 per cent, were females. Minors under the age of eighteen constituted 8.8 per cent of the total number of employees, while minors under sixteen years of age constituted 2.1 per cent. Under the head of ''Miscellaneous'' there were inspected 108 establishments, employing a total of 2,718 persons, of whom 2,299, or 84.6 per cent, were males, and 419, or 15.4 per cent, were females. Minors under the age of eighteen years constituted 1.5 per cent of the total, while minors under the age of sixteen years constituted 0.2 per cent.

In the total of 1,998 establishments inspected in San Francisco, there were employed 60,416 persons, of whom 44,494, or 73.6 per cent, were males, and 15,922, or 26.4 per cent, were females. Minors under eighteen years constituted 4.9 per cent of the total number employed, while minors under sixteen years constituted 0.9 per cent.

Table II.

In the city of Los Angeles, 1,533 establishments were inspected. Under the head of ''Manufacturing'' there were inspected 809 establishments employing 29,618 persons, of whom 23,195, or 78.3 per cent, were males, and 6,423, or 21.7 per cent, were females. Minors under the age of eighteen years constituted 3.1 per cent of the total number employed, while minors under the age of sixteen years constituted 0.2 per cent. Under the head of ''Wholesale'' 211 establishments were inspected, employing a total of 5,778 persons, of whom 4,915, or 85.1 per cent, were males, and 863, or 14.9 per cent, were females. Minors under the age of eighteen years constituted 2.6 per cent of the total, while minors under the age of sixteen years constituted 0.2 per cent. Under the head of ''Retail'' there were inspected 442 establishments, employing 12,249 persons, of whom 6,730, or 54.9 per cent, were males, and 5,519, or 45.1

per cent females. Minors under the age of eighteen years constituted 7.9 per cent of the total, while 2.2 per cent were minors under the age of sixteen years. Under the head of "Miscellaneous" 71 establishments were inspected, employing a total of 2,000 persons, of whom 1,803, or 90.1 per cent, were males, and 197, or 9.9 per cent, females. Minors under the age of eighteen years constituted 1.1 per cent of the total. No minors under sixteen years of age were employed.

In the total of 1,533 establishments inspected in the city of Los Angeles there were employed 49,645 persons, of whom 36,643, or 73.8 per cent, were males, and 13,002, or 26.2 per cent, were females. Minors under the age of eighteen years constituted 4.2 per cent of the total number employed, while minors under the age of sixteen years constituted 0.7 per cent.

Table III.

In the city of Oakland, 332 establishments were inspected. Under the head of "Manufacturing" there were inspected 205 establishments, employing 6,491 persons, of whom 4,888, or 75.3 per cent, were males, and 1,603, or 24.7 per cent, females. Minors under the age of eighteen years constituted 8.5 per cent of the total number of employees, while minors under the age of sixteen years constituted 1.2 per cent. Under the head of "Wholesale" 20 establishments were inspected, employing a total of 286 persons, of whom 239, or 83.6 per cent, were males, and 47, or 16.4 per cent, females. Minors under the age of eighteen years constituted 1.0 per cent, while minors under the age of sixteen years constituted 0.3 per cent. Under the head of "Retail" 92 establishments were inspected, employing 2,616 persons, of whom 1,427, or 54.5 per cent, were males, and 1,189, or 45.5 per cent, females. Minors under the age of eighten years constituted 10.1 per cent of the total, while minors under the age of sixteen years constituted 3.2 per cent. Under the head of "Miscellaneous" there were inspected 15 establishments, employing a total of 195 persons, of whom 159, or 81.5 per cent, were males, and 36, or 18.5 per cent, females. No minors were employed.

In the total of 332 establishments inspected in the city of Oakland, there were employed 9,588 persons, of whom 6,713, or 70.0 per cent, were males, and 2,875, or 30.0 per cent, females. Minors under the age of eighteen years constituted 8.6 per cent of the total number employed, while minors under the age of sixteen years constituted 1.7 per cent.

Table IV.

In the city of Sacramento there were inspected a total of 170 establishments, employing 4,857 persons, of whom 3,446, or 70.9 per cent, were males, and 1,411, or 29.1 per cent, females. Minors under the age of eighteen years constituted 7.1 per cent of the total number of employees, while minors under the age of sixteen years constituted 1.7 per cent.

Table V.

In the city of San José there were inspected 115 establishments, employing a total of 1,961 persons, of whom 1,390, or 70.9 per cent, were males, and 571, or 29.1 per cent, were females. Minors under the age of eighteen years constituted 4.8 per cent of the total number of employees, while minors under the age of sixteen years constituted 0.5 per cent.

Table VI.

In the city of Stockton there were inspected 101 establishments, employing 2,630 persons, of whom 2,099, or 79.8 per cent, were males, and 531, or 20.2 per cent, were females. Minors under the age of eighteen years constituted 4.8 per cent of the total, while minors under the age of sixteen years constituted 0.6 per cent.

Table VII.

In the city of San Diego there were inspected 204 establishments, employing a total of 3,722 persons, of whom 2,759, or 74.1 per cent, were males, and 963, or 25.9 per cent, females. Minors under the age of eighteen years constituted 4.6 per cent of the total employees, while minors under the age of sixteen constituted 1.6 per cent.

Table VIII.

In the city of Berkeley there were inspected 73 establishments, employing 1,500 persons, of whom 1,132, or 75.5 per cent, were males, and 368, or 24.5 per cent, females. Minors under the age of eighteen years constituted 5.3 per cent of the total number of employees, while minors under the age of sixteen years constituted 0.5 per cent.

Table IX.

In the city of Alameda there were inspected 32 establishments, employing 1,094 persons, of whom 1,018, or 93.1 per cent, were males, and 76, or 6.1 per cent, females. Minors under the age of eighteen years constituted 2.8 per cent of the total number of employees, while minors under the age of sixteen years constituted 0.1 per cent.

Table X.

In the city of Pasadena there were inspected 92 establishments, employing 1,277 persons, of whom 898, or 70.3 per cent, were males, and 379, or 29.7 per cent, females. Minors under the age of eighteen years constituted 2.0 per cent of the total, while minors under the age of sixteen years constituted 0.4 per cent.

Tables XI and XII.

In the "Miscellaneous Towns" of the State there were inspected 533 establishments, employing a total of 11,859 persons, of whom 9,729, or 82.0 per cent, were males, and 2,130, or 18.0 per cent, females. Minors under the age of eighteen years constituted 4.0 per cent of the total number of employees, while minors under the age of sixteen years constituted 0.8 per cent.

Table XIII.

A total of 5,183 estalishments were inspected in the State. These establishments employed 148,549 persons, of whom 110,321, or 74.3 per cent, were males, and 38,228, or 25.7 per cent, females. Minors under the age of eighteen years constituted 4.8 per cent of the total number of employees, while minors under the age of sixteen years constituted 0.9 per cent.

ORGANIZED LABOR.

The figures presented in this chapter do not represent all the labor organizations in the State of California; in fact, only 406 unions are reported out of a total of over 1,000. But as this is the first attempt to make an extended report on these organizations, we must be satisfied with the result, for it will serve as a foundation for future investigations. Furthermore, the unions reporting are representative, and include the majority of the organizations in the larger cities, while those failing to report were mostly located in the smaller towns.

We have adopted the following classification—which is used by the New York Bureau—as we believe there should be some attempt at uniformity in the compilation of statistics of this kind, so as to make them valuable for comparison.

CLASSIFICATION OF LABOR ORGANIZATIONS.

I. BUILDING, STONE WORKING, ETC.
  Stone working.
  Building and paving trades.
  Building and street labor.
II. TRANSPORTATION.
  Railways.
  Navigation.
  Teaming and cab driving.
  Freight handling.
  Telegraphs.
III. CLOTHING AND TEXTILES.
  Garments.
  Shirts, collars and laundry.
  Hats, caps and furs.
  Boots, shoes and gloves.
  Textiles.
IV. METALS, MACHINERY AND SHIPBUILDING.
  Iron and steel.
  Other metals.
  Shipbuilding.
V. PRINTING, BINDING, ETC.
VI. WOOD WORKING AND FURNITURE.
VII. FOOD AND LIQUORS.
  Food products.
  Beverages.
VIII. THEATERS AND MUSIC.
IX. TOBACCO.

- X. RESTAURANTS, TRADE, ETC.
  - Hotels and restaurants.
  - Barbering.
  - Retail trade.
- XI. PUBLIC EMPLOYMENT.
- XII. STATIONARY ENGINEMEN.
- XIII. MISCELLANEOUS.
  - Paper and paper goods.
  - Leather and leather goods.
  - Glass and glassware.
  - Cement and clay products.
  - Other distinct trades.
  - Mixed employment.

---

[3] From March 2 to June 30, 1912.

[4] Leased to Southern Pacific Company March 1, 1912.

[5] Began operating April 1, 1912.

[6] Includes station agents.

[10] Began operating May 1, 1912.

[11] No statistics reported.

[12] For seven months—December 1, 1911, to June 30, 1912.

JAPANESE.

JAPANESE STATISTICS.

Tables 1 to 27, on Japanese engaged in commercial pursuits in California, are compiled from data gathered during the investigation of Japanese of this State by the previous commissioner of this bureau, in accordance with an Act of the Legislature of 1909. The data collected on Japanese engaged in business was very complete, covering a record of 2,548 establishments, and showing conditions during the year 1909.

Of the 2,548 establishments investigated, 1,934 were owned by individuals, 550 by partnerships and 64 by corporations. The capital invested in these establishments was, in most instances, very small, 68.7 per cent of the total having a capital of less than $1,000. The total aggregate capital invested, exclusive of that represented by banks, was $4,075,226. The total annual business transacted by these establishments amounted to $16,114,407, of which about 37.0 per cent was carried on with white persons. The total annual rent paid by these Japanese business houses was over $900,000. Data obtained from 435 establishments engaged in the sale of food, clothing, general merchandise, etc., and whose annual business amounted to over $10,000,000, showed that 47.8 per cent of all their wares were produced in the United States, while 51.9 per cent were imported from Japan and 0.3 per cent from other countries.

The following table shows the length of time these establishments had been in business at the time of the investigation:

Date of establishment.	Number of establishments.	Per cent of totals.
1909	494	19.4
1908	617	24.2
1907	438	17.2
1906	405	15.9
1905	170	6.7
1904	129	5.1
1903	81	3.2
1902	70	2.7
1901	26	1.0
1900	16	0.6
Prior to 1900	58	2.3
Not known	44	1.7
Totals	2,548	100.0

In the conduct of these establishments, 6,556 persons were engaged, of which number 2,546 males and 562 females—principally wives of owners—were classed as employers and 3,214 males and 234 females as employés. In addition there were employed by these Japanese firms 35 male and 20 female white persons. In 1,410 instances, or 55.3 per cent of the total, the establishments were conducted entirely by the owners without the assistance of any employés. In 1,782 establishments, or 69.9 per cent of the total, employés were lodged at the place of work.

The sanitary condition of the places of work was reported as follows: Sanitation good, 81.8 per cent; sanitation fair, 16.8 per cent; sanitation bad, 1.4 per cent.

The sanitary condition of the lodging places was reported as follows: Sanitation good, 68.5 per cent; fair, 27.3 per cent; bad, 4.2 per cent.

Of the total number of establishments investigated 1,568, or 61.5 per cent, were located in the seven larger cities, as follows:

Los Angeles	505 establishments.
San Francisco	497 establishments.
Oakland	178 establishments.
Sacramento	154 establishments.
Fresno	101 establishments.
San Jose	79 establishments.
Stockton	54 establishments.

Although San Francisco did not have the largest number of establishments, 34.0 per cent of all the capital was represented there, and 40.2 per cent of the total business transacted by these Japanese firms was done in that city.

Ten hours constituted the prevailing number of hours that the Japanese employés were obliged to work, and the ruling rates of wages paid to them by their Japanese employers were from $25 to $35 per month with board, and $40 to $50 per month without board.

In tables 28 to 32 will be found a record of the land owned and leased by Japanese in the State of California, as shown by the official records of the various county assessors and recorders. Figures gathered in 1909 are also given in order to show the increases and decreases of land ownership during the past three years.

The following extracts from the above mentioned tables will show at a glance the important facts relating to the ownership of land by Japanese:

Farm Land Owned by Japanese.

(Assessment rolls March, 1912.)

Number of farms		331
Total number of acres		12,726
Assessed value—		
Land	$478,990 00	
Improvements	130,615 00	
Total		$609,605 00

Comparison of Assessment Rolls of 1909 and 1912.

Total number of acres, 1909	10,791
Total number of acres, 1912	12,726
Increase—number of acres	1,935
Total assessed valuation, 1909	$397,298 00
Total assessed valuation, 1912	609,605 00
Increase—assessed valuation	212,307 00

Town Lots Owned by Japanese.

(Assessment rolls March, 1912.)

Number		218
Assessed value—		
Land	$136,955 00	
Improvements	98,720 00	
Total		$235,675 00

SOCIAL.

SOCIAL.

Table I.

In presenting statistics on divorce, only final decrees have been considered, no account being taken of interlocutory decrees.

During the fiscal year ending June 30, 1911, 25,991 marriages were recorded in the State of California. During the same period there were granted 3,700 final decrees of divorce, the percentage of divorce to marriage being 14.2 per cent, or about one divorce to every seven marriages. In the county of San Francisco there were 5,013 marriages and 1,028 divorces, or more than one divorce to every five marriages. In Los Angeles County there were 5,824 marriages and 731 divorces, or about one divorce to every eight marriages. In Alameda County there were 2,469 marriages and 438 divorces, or more than one divorce to every six marriages. Alpine and Mono were the only counties in which no divorces were granted. Marin County had 944 marriages and only 26 divorces, or less than one divorce to every 35 marriages. Very nearly this same ratio prevailed in both Orange County and San Luis Obispo County.

Of the total of 3,700 divorces granted in the State, 960 or 26.2 per cent were the result of actions in which husbands were plaintiffs, and 2,730 or 73.8 per cent were the result of actions in which wives were plaintiffs. In the county of San Francisco 25.3 per cent of the actions were brought by husbands, and 74.7 per cent by wives. In Los Angeles County 27.4 per cent were brought by husbands, and 72.6 per cent by wives. In Alameda County 24.0 per cent were brought by husbands, and 76.0 per cent by wives.

Of the total number of couples to whom divorces were granted, 2,373, or 64.2 per cent, were married in California; 1,023 couples, or 27.6 per cent, were married in the United States, excluding California; 127 couples, or 3.4 per cent, were married in foreign countries, while in 177 instances the place of marriage was not stated.

In San Francisco County 64.8 per cent were married in California and 24.2 per cent in the United States outside of California. In Los Angeles County 46.5 per cent were married in California and 45.7 per cent in the United States outside of California. In Alameda County 65.8 per cent were married in California and 22.4 per cent in the United States outside of California.

Table II.

Divorces were granted to couples married less than five years in 714 instances; to couples married five to ten years in 1,542 instances; to couples married eleven to twenty years in 933 instances; and to couples married over twenty years in 479 instances, representing respectively 19.3 per cent; 41.7 per cent; 25.2 per cent; and 12.9 per cent of the total. The percentages of the total—represented by couples married over ten years—were 38.1 per cent for the State as a whole; 33.2 per cent for the county of San Francisco; 39.1 per cent for the county of Los Angeles; and 38.8 per cent for the county of Alameda.

Table III.

Of the total number of divorces 156, or 4.2 per cent, were granted for adultery; 1,085, or 29.3 per cent, for extreme cruelty; 1,667, or 45.1 per cent, for wilful desertion; 609, or 16.5 per cent, for neglect and failure to provide; 141, or 3.8 per cent, for intemperance; and 35, or 0.9 per cent, for conviction of a felony.

Table IV.

Of the total of 3,700 couples to whom divorces were granted, 1,821, or 49.2 per cent, were without children. In San Francisco County 68.4 per cent of the couples were without children. In Los Angeles County 63.6 per cent; and in Alameda County 36.1 per cent. In the State there were about seven minor children to every ten divorces. In San Francisco County there were about five children to every ten divorces, while in Los Angeles and Alameda counties the ratio was about six children to every ten divorces. There were 2,547 minor children affected by the granting of divorces in the State. Of this number, 638, or 25.1 per cent, were less than five years of age; 963, or 37.8 per cent, from five to ten years of age; and 788, or 30.9 per cent, were over ten years of age. In 158 instances the ages were not given.

Table V.

During the fiscal year ending June 30, 1912, 28,969 marriages were recorded in the State. During the same period 3,949 final decrees of divorce were granted, the percentage of divorce to marriage being 13.6 per cent, or about one divorce to every seven marriages. In the county of San Francisco there were 5,500 marriages and 1,049 divorces, or about one divorce to every five marriages. In Los Angeles County there were 6,878 marriages and 941 divorces, or about one divorce to every seven marriages. In Alameda County there were 2,670 marriages and 482 divorces, or about one divorce to every six marriages. Alpine and Mono were the only counties in which no divorces were granted. In the counties of Marin, Modoc and Orange there were more than fifty marriages recorded to every divorce granted.

Of the total of 3,949 divorces granted in the State, 1,098, or 27.8 per cent, were the result of actions in which husbands were plaintiffs, and 2,851, or 72.2 per cent, were the result of actions in which wives were plaintiffs. In San Francisco County 25.6 per cent of the actions were brought by husbands and 74.4 per cent by wives. In Los Angeles County 28.2 per cent were brought by husbands and 71.8 per cent by wives. In Alameda County 27.8 per cent were brought by husbands and 72.2 per cent by wives.

Of the total number of couples to whom divorces were granted, 2,544, or 64.4 per cent, were married in California; 1,084, or 27.5 per cent, were married in the United States, excluding California; 155, or 3.9 per cent, were married in foreign countries; while in 166 instances the place of marriage was not stated. In San Francisco County 67.4 per cent were married in California and 23.0 per cent in the United States outside of California. Los Angeles County showed only 46.9 per cent married in California, with 42.9 per cent married in the United States outside of California. In Alameda County 67.8 per cent were married in California and 24.1 per cent in the United States outside of California.

Table VI.

Divorces were granted to couples married less than five years in 725 instances; to couples married from five to ten years in 1,664 instances; to couples married from eleven to twenty years in 1,050 instances; and to couples married over twenty years in 473 instances, representing, respectively, 18.4 per cent; 42.1 per cent; 26.6 per cent; and 12.0 per cent of the total. The percentages of the total represented by couples married over ten years were 38.6 per cent for the State as a whole; 34.5 per cent for the county of San Francisco; 38.9 per cent for the county of Los Angeles; and 40.9 per cent for the county of Alameda.

Table VII.

Of the total number of divorces granted, 141, or 3.6 per cent, were for adultery; 1,165, or 29.5 per cent, for extreme cruelty; 1,799, or 45.6 per cent, for wilful desertion; 664, or 16.8 per cent, for neglect and failure to provide; 140, or 3.5 per cent, for intemperance; and 34, or 0.9 per cent, for conviction of a felony.

Table VIII.

Of the total of 3,949 couples to whom divorces were granted, 2,069, or 52.4 per cent, were without children. In San Francisco County 49.5 per cent were without children; in Los Angeles County 66.5 per cent; and in Alameda County 68.3 per cent. In the State there were about seven minor children to every ten divorces; in San Francisco County about five; in Los Angeles County about six; and in Alameda County about seven. There were 2,622 minor children affected by the granting of divorces. Of this number, 649, or 24.8 per cent, were less than five years of age; 1,009, or 38.5 per cent, were from five to ten years of age; and 819, or 31.2 per cent, were over ten years. In 145 instances the ages were not given.

In the table following is given the number of marriages and divorces in the State of California for the six fiscal years ending June 30, 1912:

Fiscal year.	Number of marriages.	Number of divorces.	Percentage of divorce to marriage.
1906-07	22,734	2,177	9.6
1907-08	22,238	2,783	12.5
1908-09	22,244	3,087	13.9
1909-10	23,645	3,334	14.1
1910-11	25,991	3,700	14.2
1911-12	28,969	3,949	13.6

During the four fiscal years ending June 30, 1910, the percentage of divorce to marriage showed a marked increase in the State. In the fiscal year 1906-07 there existed the approximate ratio of one divorce to every ten marriages, while in 1909-10 this ratio had become, by yearly increases, one divorce to every seven marriages. Since 1909-10 the percentage has remained practically stationary, with even a slight decrease in the year just past—1911-12, when the ratio was approximately one divorce to every seven and one half marriages.

Much the same condition of affairs has existed in the three largest counties of the State. In the fiscal year 1906-07, the ratio in San Francisco County was one divorce to every eight marriages. By 1909-10 this ratio had become one divorce to every five marriages, and approximately this ratio was in force in the two succeeding years. In Los Angeles County the ratio increased from one divorce to eleven marriages in 1906-07; to one divorce to seven marriages in 1909-10, was one to eight in 1910-11, and again one to seven in 1911-12. In Alameda County the ratio was one to eighteen in 1906-07, had increased to one to six in 1909-10, and was one to six in both 1910-11 and 1911-12.

TABLE No. 16. Commitments to State Reform Schools for fiscal year ending June 30, 1912.

(Showing grade reached by child on leaving school.)

Grade.	Total.	Male.	Female.
First grade	14	13	1
Second grade	8	8	----------
Third grade	32	32	----------
Fourth grade	36	31	5
Fifth grade	42	40	2
Sixth grade	26	25	1
Seventh grade	31	30	1
Eighth grade	36	33	3
Ninth grade	2	1	1
High school	11	10	1
College	1	1	----------
Not stated	87	64	23
No schooling	7	7	----------
Totals	333	295	38

TABLE No. 17. Commitments to State Reform Schools for fiscal year ending June 30, 1911.

(Showing status of parents of children committed.)

Status.	Total.	Male.	Female.
Parents living together	124	107	17
Parents separated	38	28	10
Parents divorced	29	28	1
One parent dead	115	105	10
Both parents dead	23	22	1
Not stated	9	7	2
Totals	338	297	41

TABLE No. 18. Commitments to State Reform Schools for fiscal year ending June 30, 1912.

(Showing status of parents of children committed.)

Status.	Total.	Male.	Female.
Parents living together	128	117	11
Parents separated	37	29	8
Parents divorced	26	21	5
One parent dead	108	96	12
Both parents dead	26	25	1
Not stated	8	7	1
Totals	333	295	38

TABLE No. 19. Commitments to State Reform Schools for fiscal year ending June 30, 1911.

(Showing with whom child resided at time of commitment.)

Living with.	Total.	Male.	Female.
Both parents	112	98	14
Father	42	35	7
Mother	112	98	14
Neither parent	69	63	6
Not stated	3	3	----------
Totals	338	297	41

TABLE No. 20. Commitments to State Reform Schools for fiscal year ending June 30, 1912.

(Showing with whom child resided at time of commitment.)

Living with.	Total.	Male.	Female.
Both parents	100	93	7
Father	41	37	4
Mother	83	71	12
Neither parent	68	63	5
Not stated	41	31	10
Totals	333	295	38

TABLE No. 21. Commitments to State Reform Schools for fiscal year ending June 30, 1911.

(Showing addiction of parents to liquor.)

Addicted to use of liquor.	Total.	Male.	Female.
Both parents	7	4	3
Father	75	64	11
Mother	4	3	1

LETTER OF TRANSMITTAL.

SACRAMENTO, CALIFORNIA.

To the Governor and the Legislature of California:

In compliance with the provisions of Chapter 408, Statutes of 1911, creating and establishing this Commission to investigate and report on certain specified subjects of conservation, and to recommend legislation relative thereto, the Commission begs to submit this report and the exhibits hereto attached.

Respectfully submitted this 1st day of January, 1913.

CONSERVATION COMMISSION OF THE
STATE OF CALIFORNIA.
GEORGE C. PARDEE, Chairman.
FRANCIS CUTTLE.
J. P. BAUMGARTNER.

LOUIS R. GLAVIS, Secretary.

ACT CREATING COMMISSION.

The Conservation Commission was created by the following act of the legislature:

Chapter 408.

An act creating and establishing a commission for investigating and gathering data and information concerning the subjects of forestry, water, the use of water, water power, electricity, electrical and other power, mines and mining, mineral and other lands, dredging, reclamation and irrigation, and for revising, systematizing and reforming the laws of this state upon, concerning, regarding or appertaining to these said subjects; providing for the appointment of said commission to be known as the "Conservation Commission of the State of California"; prescribing the powers and duties of said commission and its members and providing for the expenses of said commission and appropriating money therefor.

[Approved April 8, 1911.]

The people of the State of California, represented in senate and assembly, do enact as follows:

Section 1. A commission consisting of three persons which shall be known and designated as the "Conservation Commission of the State of California," is hereby created and established for the purpose of investigating and gathering data and information concerning the subjects of forestry, water, the use of water, water power, electricity, electrical or other power, mines and mining, mineral and other lands, dredging, reclamation and irrigation, and for the purpose of revising, systematizing and reforming the laws of this state, upon, concerning, regarding or appertaining to these said subjects.

Sec. 2. Said commission shall be appointed by the governor, and shall enter upon the performance of its duties immediately. The members of said commission shall hold office at the pleasure of the governor. In case of a vacancy in said commission, such vacancy shall be filled by appointment by the governor.

Sec. 3. It shall be the duty of said commission to investigate and examine the laws of the United States, of foreign nations, of the states of the union and of this state, and the reports and recommendations of persons, officials, commissions, societies and associations upon the subjects of forestry, water, the use of water, water power, electricity, electrical and other power, mines and mining, mineral and other lands, dredging, reclamation and irrigation and to prepare and recommend to the legislature laws, statutes and constitutional amendments revising, systematizing and reforming the laws of this state upon forestry, water, the use of water, water power, electricity, electrical and other power, mines and mining, mineral and other lands, dredging, reclamation and irrigation. The said commission is hereby authorized and empowered to do and perform the acts and things required of it by this act, and to adopt all rules and regulations necessary to carry out the provisions of this act.

Sec. 4. The said commission is hereby empowered and authorized to have printed by the state printer its reports, records and proceedings in the manner provided by law.

Sec. 5. It is hereby made the duty of the attorney general, serveyor general, the state engineer and all other state officers to render such aid and assistance to said board as said board may require.

Sec. 6. For the purpose of carrying out the provisions of this act the said commission is authorized to employ such expert, technical, professional and clerical assistance and upon such terms as it may deem proper.

Sec. 7. In order to carry out the provisions of this act the members of said commission or any person authorized by it are authorized to enter and cross all lands within this state, and to make all proper and necessary surveys and measurements of land and water; *provided*, that in doing so no damage is done to private property: and it shall be a misdemeanor, for any person or persons to wilfully and maliciously remove or destroy any permanent marks or monuments made or erected by said commission or any person or persons under its direction or authorization, or to prevent the members of the said commission or any person authorized by said commission to enter and cross any land within this state or to make surveys and measurements of land and water.

Sec. 8. Said commission shall receive no salary for their services but shall be allowed their actual expenses while in the performance of their duties as in this act provided.

Sec. 9. The sum of $100,000 is hereby appropriated out of the funds of the state not otherwise appropriated for the purposes of carrying out the provisions of this act, and the state controller is hereby authorized and directed to draw warrants upon such sum from time to time upon the requisition of said conservation commission approved by the board of examiners, and the state treasurer is hereby authorized and directed to pay such warrants.

Sec. 10. All acts or parts of acts in conflict herewith are hereby repealed.

Sec. 11. This act shall take effect immediately.

PERSONNEL OF COMMISSION.

The Governor appointed the following as members of the Commission: George C. Pardee, of Oakland, who was chosen by the Commission as its chairman; Ralph W. Bull, of Eureka; Francis Cuttle, of Riverside. Mr. Bull, owing to press of private business, resigned in August, 1911, and J. P. Baumgartner, of Santa Ana, was appointed in his place. Louis R. Glavis was appointed secretary on August 12, 1911.

FINANCIAL STATEMENT OF COMMISSION.

The sum of $100,000.00 was appropriated for the purposes of this Commission. Of this amount $54,760.18 has been expended in the course of eighteen months, that is to say, from May 1, 1911 to November, 1912.

Appropriation		$100,000 00
Co-operative agreement with U. S. Geological Survey	$14,615 27	
Co-operative agreement with U. S. Department of Agriculture	15,546 58	
Salaries	8,364 51	
Office expenses	2,656 78	
Traveling expenses	2,243 67	
Contingent (including collecting of certain data and other information)	5,803 94	
Commissioners' expenses	2,203 39	
Property	1,039 75	
State Board of Forestry, co-operative (gathering timber data)	724 16	
Underground water investigations	1,562 13	
Overpayment by Board of Control and refund on scrip book	28 48	
Total disbursements		54,788 66
		$45,211 34
By refund to Controller		28 48
Balance		$45,239 82

Vouchers for all these expenditures, properly itemized and authenticated, are on file in the office of the State Board of Control.

Statement of moneys expended to November 1, 1912, and set aside under co-operative agreement, some of which is not yet expended.

		Expended.
Set aside under co-operative agreement with U. S. Geological Survey	$23,851 00	
Disbursed	14,615 27	$14,615 27
Balance	$9,235 73	
Set aside under co-operative agreement with U. S. Department of Agriculture	$21,150 00	
Disbursed	15,546 58	15,546 58
Balance	$5,603 42	
Fixed expenses (salaries and traveling expenses)	$15,887 50	
Disbursed	10,608 18	10,608 18
Balance	$5,279 32	
Operating expenses, office, etc.	$5,662 75	
Disbursed	3,696 53	3,696 53
Balance	$1,966 22	
Contingent expenses, gathering data, school lands, etc.	$10,000 00	
Disbursed	5,803 94	5,803 94
Balance	$4,196 06	
Commissioners' expenses	$2,825 00	
Disbursed	2,203 39	2,203 39
Balance	$621 61	
State Board of Forestry	$754 75	
Disbursed	724 16	724 16
Balance	$30 59	
Underground water investigations with U. S. Geological Survey (Lee)	$1,900 00	
Disbursed	1,562 13	1,562 13
Balance	$337 87	
		$54,760 18
Overpayment by Board of Control and refund on scrip books		28 48
Total disbursements		$54,788 66

Appropriation	$100,000 00
Refund	28 48
	$100,028 48
Disbursements	54,788 66
	$45,239 82
Appropriation and refund	$100,028 48
Set aside	89,881 00
Balance unappropriated	$10,147 48

REPORT OF COMMISSION.

To the Governor and the Legislature of the State of California:

The task of the Conservation Commission has not been an easy one. It has had less than a year and a half in which to do the work laid out for it, which was to make, as well as may be, a survey of the natural resources of this State, as set forth in the act of the Legislature creating the Commission, collect data thereon, and to propose to the Legislature such laws, based on that data, as might appear practicable for the conservation of those natural resources.

One great difficulty with which the Commission has had to contend is the fact that the collection of the data necessary for the formulation of recommendations upon all the matters referred to it by the Legislature has, in all cases, required a long time, even when the Commission has availed itself, as it has in all cases where it has been possible, of the already organized forces of other departments of the state government and of the various departments of the Federal Government. In such matters as the flow of streams and the determining of underground water supply, it is at once evident that the data necessary for the formulating of recommendations by this Commission could not be gathered in the time at the disposal of the Commission with sufficient accuracy for the formulation of such recommendations. Such data must be gathered during all the seasons of the year, and, under conditions of varying annual rainfall, such as are characteristic of California, must be gathered during many successive years in order to be of the greatest possible value. The data gathered by the coöperating agents of the Commission and set forth in this report will, the Commission believes, prove of sufficient value to warrant the comparatively slight expense of their gathering.

COÖPERATIVE AGREEMENTS.

In surveying the field of its operations, the Conservation Commission came, at the very beginning, to the conclusion that it would be neither economical nor efficient for it to organize forces for the investigation of such matters as irrigation, the area and location of irrigable lands, and the gaging and examination of streams with regard thereto. It realized fully that the United States, through its Department of Agriculture, with its various bureaus, and the Department of the Interior, principally through the various branches of the Geological Survey, had regularly organized and equipped and trained persons engaged in exactly the work that this Commission contemplated doing. The Commission also realized that, were it to attempt to do the work already being done by these departments of the Federal Government, much time, money and effort would be wasted in duplicating work already in process under government supervision. Furthermore, the Commission realized that it could not do this work so cheaply or so well as the government is doing it; and that, for all these reasons, it would be best for the Commssion to coöperate with these trained government agencies in the collection of the required data. Upon consultation with Mr. Frank Adams, of the Irrigation Investigations, U. S. Department of Agriculture, and Messrs. M. O. Leighton, W. C. Mendenhall, J. C. Hoyt and H. D. McGlashan of the U. S. Geological Survey, the Government officials—Messrs. Fortier, True, George Otis Smith and others—very kindly consented to coöperate with this Commission, putting at our disposal their trained men and organizations, in return for the Commission paying the greater portion, but not all, of the expenses incurred in the work.

The results of this coöperation have been entirely satisfactory. The work has been rapidly done, and with far more efficiency and at far less expense to the State than would have been the case had the Commission attempted to do the work itself.

The texts of the coöperative agreements with the U. S. Departments of the Interior and Agruculture are set forth in this report in their proper places.

THEORY OF FREE GIFTS OF NATURAL RESOURCES.

It was the theory of our forefathers, who inaugurated the practice by which individuals have secured private property rights in natural resources, that such resources are of no good to the public unless they are used for the public benefit. This theory is, beyond question, correct. But those who put that theory into practice went a step farther. They reasoned that, in order to get these natural resources used for the benefit of the public, it would be necessary to allow them to become private property. That this theory is not correct is proven by the fact that other countries—most of them, in fact—succeed in getting their natural resources used for the benefit of the public without disposing of them and without permitting them to be monopolized or unnecessarily wasted or destroyed, as we have permitted most of ours to be. The result has been that these other and more farsighted countries have conserved their natural resources.

Our forefathers, proceeding on the theory that it was necessary to give our natural resources away in order to keep them from being unused, disposed of them with a free hand. The contrary result from that which they expected would follow has, in a great measure, resulted. Desiring to get these natural resources out of public ownership cold storage, they permitted them to be put into private cold storage, where they are used only somewhat more than they would have been used in public cold storage. The enormous, unused forests, in private cold storage in this State, and the enormous cold-storaging and nonuse of coal lands in private ownership in other parts of the country are cases in point.

Desiring to prevent the economic waste by nonuse, of the natural resources of this country, our forefathers gave them away. The result has been that most of these natural resources have been wasted and destroyed because of the desire of their private owners to get rich quick.

The public has use, to be sure, but only a use limited by the very natural, human greed of those who are the public's successors in ownership of those natural resources. And, as a result of that very natural greed, the public is compelled to pay unnecessarily high prices for the limited use which it enjoys of the natural resources it once owned.

With this condition of affairs the Conservation Commission has no serious quarrel. Its members freely admit that, had they had the opportunity, they would, in the pursuit of quickly-acquired and enormous fortunes, also have wasted, destroyed, monopolized and cold-storaged any natural resources which might have fallen into their ownership. But the Commission, nevertheless, confidently asserts that the burden of the public would be none the less if its members, in common with others, had wasted, destroyed, monopolized, or cold-storaged such natural resources as they might have acquired.

True, in other countries which have not given away their natural resources there have not been such opportunities as there have been and still are in our country for the amassing, at the cost of the public, of enormous private fortunes in a few years by the monopolization, wasting, destruction, or even cold-storaging of their natural resources, as has been the case in our country. But the opinion seems to be quite prevalent, at least among those many millions of the American people, who, bearing the burdens caused by the giving away of the natural resources, do not correspondingly share in the benefits derived by the donee, that such fortunes are not balanced by corresponding public benefits.

Had our forefathers been able to foresee the bad economic results of coal, forest, water and other monopolies, wastes, destructions and cold-storagings resulting from their mistaken gifts of them, it is safe to say that the policy of giving our natural resources into private ownership would never have been followed, with the exception, perhaps, of the case of lands. This latter resource, being essential to the prevention of a land-owning aristocracy with all its attending evils, will be, everybody but the Socialists seems to think, better used for the public good if it is in the private ownership in small areas of those who, because of that ownership, will take care of it, and because of small areas can do so.

WATER THE ONLY NATURAL RESOURCE LEFT TO CALIFORNIA.

Water is practically the only natural resource left to the full regulation of the State of California. It is, equally with land and even more than the forests, of the greatest necessity for the prosperity and comfort of our people. Neither it nor its use ought to have been permitted to become, in any shape or manner, private property. With that portion of it, or the use of that portion of it, which has already been permitted to become private property, we have, at present, little to do, beyond so regulating the enjoyment of it by its present owners that it will be as little as possible provocative of public distress or inconvenience. But that portion of this natural resource which has not yet fallen into private control or ownership should not be permitted to do so. And that portion of it which is illegally privately-controlled or owned should be restored to public ownership and control. The only way, of course, in which that may be accomplished is by giving to some state agency the power to investigate conditions and initiate proceedings looking to their judicial restoration to the public.

THEORY AND PRACTICE OF CONSERVATION.

"Conservation of the natural resources" should consist, in the view of this Commission, not necessarily in the preservation of those resources, but in the use of them, in such quantities, under such conditions and at such times as the needs of the people require; without, however, any unnecessary waste or destruction, and without permitting them to become the subjects of monopolies detrimental to the public good.

There are natural resources which are absolutely necessary to the progress and prosperity of the public. Among them are conspicuously land, water, forests, coal, oil. Others, such as the precious metals, are of comparatively little value to the public from the standpoint of the conservationist, as they are of secondary importance to the actual, daily needs of the public.

Nobody would, the Conservation Commission believes, favor the monopoly of all the land in this State by a few score individuals. Such a monopoly always has led and always will lead to the division of a population into two classes—a small and very rich landlord class and a large and poor tenant and peasant class. The lands of the State of California have, very fortunately, been subdivided and are constantly being still more subdivided into smaller and still smaller holdings, so that the number of landowners, able to make livings from the products of their own lands, is rapidly increasing.

OWNERSHIP OF FORESTS.

But, as is shown by the table of landholdings in this report, 1,273 persons and corporations own over four and one half million acres of timber land in this State, over 4 per cent of the entire area of the whole State, or approximately 33 per cent of all the forests in the State, or practically all of the forests outside of United States reserves. Of these owners, two own over half a million acres each—one, the Southern Pacific, owning approximately 825,000 acres; the other, Mr. T. B. Walker, owning over 700,000 acres—an average of over 750,000 acres for each of these two proprietors. There are a little over 100,000,000 acres of land in this State. If 150 persons or corporations each owned 750,000 acres of land in California, all our territory—city and country, mountain, valley and desert—would be the property of that small fraction—about .00007 of 1 per cent—of our present two and a quarter millions of people.

NONUSE OF FORESTS.

A great proportion of the enormous private holdings of forest lands in this State is not being used, but is being held, without cutting the timber, for the increased price of lumber which will come as the great mass of the forests disappear—as it is now fast disappearing. The result of this is that the public, which gave these forest lands away for little or nothing, is deprived of the present benefit of the use of a large portion of the natural forest resources of this State.

For this condition of affairs, the Conservation Commission has, of course, no direct remedy to offer. Such of the owners of this timber as are in lawful possession thereof cannot be deprived of it; and the Commission, in common with all law-abiding citizens, would not deprive them of their lawfully-acquired property, even if it could. And as the Commission has not been authorized to ascertain which, if any, of the owners of enormous tracts of timber lands are not in lawful possession thereof, we have no suggestions to offer with regard thereto.

DETERIORATION OF UNUSED FORESTS.

But we would call especial attention to the fact that, because some of these enormous timber holdings are not being used, they are deteriorating because of the decay of the ripe timber, and the public loses just that much of the benefits to be derived from the use of those forests. Furthermore, because the ripe timber in these ''cold-storaged'' forests is not being cut, immature timber in other holdings is being sacrificed to supply the demands of the lumber market, with the result that an economic waste in two directions—the loss by decay of the overripe timber and (the sacrifice of unripe timber) is being suffered by the public.

FOREST DETERIORATION BY FIRE.

There is also this to be considered: Some of the owners of these enormous tracts of timber lands are averse to spending the money necessary to preserve their timber from destruction by fire. They seem to argue that it is cheaper for them, if not for the public, not to spend the money necessary to protect this natural resource, so necessary to the public, from destruction by fire. Chief among the offenders in this regard seems to be the Southern Pacific. This corporation owns over 800,000 acres of forest lands in twelve counties in this State. It was given this land for nothing; yet it has consistently opposed the passage of any adequate forest-fire legislation in this State, preferring apparently to allow its forests to be in constant danger of destruction rather than to submit to any adequate legislation looking to their protection and conservation for the public good.

FEW NATURAL RESOURCES SUBJECT TO DIRECT STATE CONTROL.

At the very outset the Commission found itself confronted with the fact that the natural resources in California which may be directly controlled, regulated, and conserved by State law, are but few in number. The disposition of all minerals for instance is controlled by federal laws. Our forests originally were, with the exception of those standing on school lands, the property of the United States, which has disposed of the best portion of them and holds the remainder in national forests, national parks and other reservations. Lands, also, with the exception of the school lands given to the State by the United States, were reserved to the Federal Government by the act of Congress admitting California as a state, and have been disposed of to private individuals, with the exception of the lands retained by the Government in the reservations above mentioned. Even the State has sold, at ridiculously low prices, the lands given to it by the Government for the purpose of supplying funds for at least the partial support of our public schools.

NECESSITY OF CONSERVING PRIVATELY-OWNED RESOURCES.

The Commission, however, realizes that even in ownership other than that of the State, certain of our natural resources are so necessary for the present and future prosperity of the people of California, that the public must, in self-protection, take such measures as may be possible for their proper conservation. Our forests, for instance, are so absolutely necessary to the conservation, even the preservation, of our streams, springs and other sources of water supply for domestic use, navigation, irrigation, the generation of electrical and other power, that, even were they all in private ownership, it would be necessary for the public to put forth every effort to prevent the forests, while being used, from being exterminated.

PRIVATELY-OWNED FORESTS ALWAYS DESTROYED.

Private ownership of the forests, unregulated by close governmental supervision and regulation, has always led to their extermination. History abounds in instances where cities, provinces and countries, once densely populated and prosperous, have suffered greatly and have even become depopulated because they permitted their forests to be destroyed, with the result that the streams, upon which they depended for the fertility of their lands, became torrents in the winter and dry beds of sand in the summer.

CALIFORNIA BEGINNING TO SUFFER.

California, young as it is, begins already to show signs of the damage that always follows the destruction of the forests. The upper reaches of some of our rivers, that have been more or less stripped of the forest protection of their water sheds, already show greater ranges between their highest and their lowest stages than they did before they lost their forest protection; and their beds are filling, more rapidly than before, with the silt torn by the unrestrained water, furnished by the rains and melting snows, from the uncovered soil.

NECESSITY FOR CONTINUOUS WATER SUPPLY.

For domestic purposes, navigation, irrigation, the development of power, and for all other uses, it is best, if not absolutely necessary, that the water supply of springs and streams shall be, as near as may be, uniform throughout the year—that there shall be small winter floods and large summer flows. But the destruction of the forests leads always to increased winter floods and decreased summer flows. In fact, forest destruction has reduced to zero the summer flow of many streams, which, before their protecting forests were destroyed, ran large all the year through. And such streams, deprived of their forests, do costly damage to property and even life by their winter floods, where, before the forests were destroyed, their flood stages did little or no damage.

DUTY OF STATE TO CONSERVE FORESTS.

It is evident, therefore, that it is the duty of the State to see to it that our forests, even such of them as are in private ownership, shall not be exterminated. Other countries than ours have long recognized the necessity for the conservation of their forests. Germany, during the last several hundred years, has, by government ownership or strict government regulation, conserved her forests. France has also done good work along this line. Other European countries have done likewise. And certain states of this Union, like New York, Maine, Wisconsin, Michigan and others, have begun to buy back, at high prices, forests, and even deforested lands that they gave away. The Federal Government, after having given away the vastly greater part of its forests, has within the last few years begun to realize the dangers of the situation, and has reserved from further spoliation and destruction large areas of forests on the headwaters of many of our streams.

INTEREST OF STATE IN PRIVATELY-OWNED FORESTS.

It is claimed that neither the State nor the Federal Government, having disposed of the forests, has any further interest in them. This would be so were it not that the forests are just as necessary to the public good in private as in public ownership; that their destruction entails just as much injury upon the public whether they be destroyed in private or in public ownership; and that the private owners of forests can make the most money in the shortest time by destroying them while lumbering them. As is shown further on hereunder, the State of New York has spent, on the recommendation of several of its Governors, several million dollars to buy back forests that it gave away for practically nothing. Even California spent $250,000 to buy for a public park, a redwood forest, which was originally given away by the public for comparatively nothing.

The Conservation Commission does not suggest or recommend that this State shall at this time spend any large sums of money for the acquisition of forest lands. But, as will appear later on in this report, it does recommend that the State acquire, or take temporary control of, large areas of cut-over lands for the purpose of initiating the reforestation thereof.

Furthermore, the State, by the exercise of its police power, can and ought to adopt such regulatory measures as will prevent, so far as may be possible, the unnecessary destruction and extermination of even the privately owned forests, either by reckless lumbering operations or by fire.

A partial discussion of the police power of the State, in regard to the regulation of privately owned forests, appears later on in this report.

WATER, FORESTS, LANDS MOST NECESSARY.

Under all the conditions that have confronted it, the Conservation Commission has been compelled to give its attention principally to the matter of the conservation of forests and water, and the conservation and even creation of soil fertility, and electrical and other power, dependent on the conservation of water. Water and forests, the Commission considers, are the most important natural resources now at the disposal of our people; and immediate attention to their conservation is required to prevent, as much as may be, the hurtful monopoly of the one and the unnecessary destruction of the other.

RESULTS OF DESTRUCTION OF NATURAL RESOURCES.

It was supposed, when the individual was given the right freely to appropriate our natural resources, that they were unlimited and inexhaustible in quantity. Less than half a century ago, for instance, it was commonly held that the redwood forests of California were of such enormous extent that they could never be all cut down; whereas, we now know that, even at the present rate of their destruction, there are people now alive whose only hope of seeing a redwood forest will lie in a visit to a public park. It was also claimed, a comparatively few years ago, that the nation's coal supply was inexhaustible. Mr. Andrew Carnegie, addressing the Conference of Governors, held in the White House in 1908, said: "When the Republic was founded, there were, according to recent expert estimates, approximately 2,000,000,000,000 tons of coal in the territory now forming the United States. Practically none of this supply was used for over a quarter century; but during the seventy-five years from 1820 to 1895 nearly 4,000,000,000 tons were mined by methods so wasteful that some 6,000,000,000 tons were either destroyed or allowed to remain in the ground forever inaccessible. During the ten years from 1896 to 1906 as much coal was produced as during the preceding seventy-five years; while more than 3,000,000,000 tons were destroyed or left in the ground beyond reach of future use. To date the actual consumption of coal has been over 7,500,000,000 tons; the waste and destruction in the neighborhood of 9,000,000,000 tons," . . . "In 1907 the production of coal was about 450,000,000 tons. At the present rate of increase the production in 1917 will be 900,000,000 tons; in 1927, 1,800,000,000 tons; and in 1937, over 3,700,000,000 tons—or an amount in that year alone equal to the production of the seventy-five years ending in 1895. And with continuation of the wasteful methods of mining, the consumption and destruction together during that one year would equal our total useful production up to the present date.''

RESULT OF UNREGULATED USE OF COAL.

The public having given the coal away and having made no provision to prevent either its waste or its monopolization, is suffering now because of the high prices it is compelled to pay for the use of property which was once its own. Charles R. Van Hise, President of the University of Wisconsin, said, at the Conference of Governors: ''Eight important railway systems now exercise an absolute monopoly over hard-coal mining. . . . . Together they own more than nine tenths of the entire anthracite deposits of Pennsylvania, and about three fourths of the total production is mined by their subsidiary coal companies.'' At the same conference Mr. James J. Hill, President of the Northern Pacific Railroad, said: ''The exhaustion of our coal supply is not in the indefinite future. The startling feature of our coal production is not so much the magnitude of the annual output as its rapid increase.'' And Mr. H. St. Clair Putnam assured the conference that, ''If the production of anthracite coal is continued only at its present annual rate, the supply will be exhausted in sixty to seventy years.''

The present generation of American citizens, therefore, is suffering financial burdens because public property, in the shape of coal, was practically given away by preceding generations without any strings on the deeds of gift.

RESULTS OF MONOPOLY OF NATURAL RESOURCES.

The monopoly of natural resources that are necessary to the public welfare always has led and always will lead to public hardships. In England and other European countries, for instance, the monopoly of land has been a very great determining factor in the division of the people into two classes—one class, very small in number, exceedingly rich; another class, very large in number, exceedingly poor. Early in the history of this nation public lands were disposed of in enormous areas to private parties—and a land-owning aristocracy of wealth was created. It soon, however, became apparent that such a condition did not comport with a democratic republic. The people, therefore, demanded and the government inaugurated a system of land disposals which sought to prevent the acquisition of the public lands in large quantities by individuals. It was the theory of the law that no man should be given more than 320 acres of the public lands, and that that land, once disposed of in such modest holdings, would continue to be so held.

U. S. GOVERNMENT FEARED MONOPOLY.

It was a like fear of timber monopoly that caused the United States Government to dispose of its timber lands in parcels not greater than 160 acres and only one such parcel to any one individual. Even in the giving of land-grant aids to some of the railroads the same idea was apparent; for some of the acts of Congress making these grants contained a provision that the granted lands should be disposed of to "actual settlers" for not more than two dollars and a half per acre, and in parcels not greater than 160 acres. However, the observance of these conditions of the acts have not always been observed by the recipients of the benefactions of the people. The Southern Pacific, for instance, has sold some of its granted lands in parcels greater than 160 acres and for more than two dollars and a half per acre; and it has refused to sell such lands to all would-be actual settlers.

In the sale or disposition of its coal lands, its desert lands and mineral lands, the Government, with the idea of preventing monopoly, has refused to part with them in large areas. Of course, though, individuals once having obtained ownership, were permitted to part with that ownership on any terms that pleased them. The result has been that enormous frauds have been perpetrated on the Government in land matters; and that, honestly or dishonestly, enormous quantities of timber, coal and other lands have fallen into monopolistic private ownership.

RESULTS OF COAL MONOPOLY.

The results of such monopolies have been apparent especially in the matter of coal and timber lands. Coal, so necessary to the public and given away by the public, has been used to extort from the public enormous sums of money, even at the expense of great privation and suffering by an appreciable percentage of the public. Even California knows what it is to be in the hands of a coal trust. There are large quantities of coal in Washington, Utah, Wyoming, New Mexico; but because the public gave that coal away, the people have been deprived of the cheap use of it. For those to whom the public gave that coal, have, very naturally and very humanly, preferred to allow some of their coal to remain unworked and unused, so that, by starving the coal market, the price of coal might be kept at as high prices as the necessities of the people would compel them to pay for it.

Had the public seen to it that its coal was not given away into private ownership, the exactions and extortions of the various coal trusts of this country, and great deprivation and suffering, could have been prevented.

WATER POWER MONOPOLY FAR REACHING.

There is no large quantity of coal, but there are many mountain streams, in this State. And from these streams is already being produced, instead of from steam, the power that supplies the place of a very large portion of the coal and oil that otherwise would be used for fuel in the generation of power. As has been said in another part of this report, it is estimated that at least 5,000,000 horse power of electric energy may be developed from the mountain streams of California, equivalent to the steam power developed by burning 100,000,000 tons of coal per annum. And that power will, one day, be doing practically all the work that can be done by steam power; and being also used for lighting, heating and power purposes in every household in this State, it will be a prime public necessity.

A monopoly, therefore, of the water power of this State would reach into every house, put under heavy tribute every person in the State, and add enormously to the burdens borne by every California industry, great or small.

MONOPOLY ALREADY FORMED.

That such monopolies are already in existence in this State goes without saying. The bond-selling prospectuses for several of our power companies make this plain. In one such prospectus, as an inducement to those contemplating buying its bonds, it is very broadly hinted that the company has a monopoly covering one third of the area of the State and over one half of its population. As an important basis for the bonds, the statement is also made that the company owns many unused valuable water rights. And the further alluring statement is made that, as the population and power needs of the State increase, the value of these, at present unused water rights will rapidly and greatly increase. It is therefore proposed to make that which the public gave away the basis for an ever-increasing tribute wrung from the necessities of the public.

NO STATE AGENCY TO RECOVER ILLEGAL APPROPRIATION.

It is true that these public service corporations can and will be regulated, after they are formed, by the California Railroad Commission. But there is no adequate power given to any part of the state government to investigate and, subject to an appeal to the courts, take away from these companies any water rights they may have illegally acquired. That power can, in practice, be exercised only by individuals. And the task of taking such matters into court, in the face of determined and long-drawn out opposition, is not one that will be welcomed by individuals. The task of defending the property of the State from illegal monopoly should be the task of the State; it should not be left to the individual.

STATE SHOULD KNOW WHAT RIGHTS ARE UNAPPROPRIATED.

Furthermore, the State, in welcoming the putting into use of her water rights, should be able to know what water rights are available for that use. It is therefore necessary that there should be some State-representing agent with the power to ascertain what water rights are legally still subject to the control of the State. To do that, it is required that that agent shall be able to know which water rights have been legally acquired and which have been illegally acquired. For the State, welcoming the development of power projects, should be able to present a legally clear and unobstructed field of operation for such development and be able reasonably to assure would-be investors that they have at their disposal certain water rights. The State does this, with reasonable certainty, in the case of land titles. It ought to do so with equally reasonable certainty in the case of the right to use of water, which is the property of the public.

WATER DISPLACES COAL AND OIL.

Falling water can supply the places of two natural power-producing resources, coal and oil, for power purposes. Transformed into electrical energy, the power of falling water can be made to do anything that fuels can do. And as it can be transported more easily, quickly and cheaply than fuels, and used simply by the turning of a switch, electrical energy will soon supplant fuels for all purposes, and can be supplied to localities inaccessible to coal or other fuels. But a past generation of Americans permitted the use of large quantities of falling water to become private property. Oil, coal and other fuel sources of power will, in a comparatively short time, become exhausted; they are already becoming and will steadily become, because of lessening quantities and monopolization, constantly higher in price. But the supply of falling water can never be exhausted until the sun refuses longer to pump it from the ocean or the force of gravitation ceases to cause it to run down hill. The only manner, therefore, in which this most valuable natural resource can be used to the detriment of the public, who own and cannot be deprived of the ownership of it, will be monopolization.

CALIFORNIA'S WATER POWERS.

Former Governor Pardee, addressing the White House Conference of Governors, said: "It has been estimated that the utilization of all the stream-power from Mt. Shasta to the Techachapi, a distance of over 500 miles, will produce 5,000,000 horsepower of electric energy, equivalent to 100,000,000 tons of coal per annum, costing at present prices over $1,000,000,000. The utilization of all this water power would therefore annually save $1,000,000,000 in cost of fuel, and produce $1,000,000,000 worth of new property. . . . . The streams from which power may be obtained have been, within the last few years, filed upon to that extent, under the lax laws of California, that the fear is expressed in many directions that the power has been already pretty well taken up. Many, if not most, of these filings are for speculative purposes only; others are for future development; but comparatively few of them are actually being used or are in process of preparation for utilization. The fear is prevalent that the acquisition of these water rights by private persons or corporations will lead to monopolies and over-capitalizations, and that these great and most important natural resources will not be at the cheap disposal of the public. In fact, already, by means of purchase, by bond and stock issues, as practiced by some of the railroad and industrial corporations, the electric power used in the various cities of Northern California has fallen very much into the hands of one corporation, which, it is claimed, is greatly over-capitalized. . . . . Bearing in mind the results of railroad monopoly by means of consolidations brought about by similar means, it is not difficult to foretell the results of similar monopolization of the power of the streams of California."

Former Governor Hughes, of New York, now Justice of the U. S. Supreme Court, in his 1907 message to the Legislature, said: "It is well to consider the great value of the undeveloped water powers. They should be preserved and held for the benefit of all the people, and should not be surrendered to private interests."

PUBLIC UTILITIES COMMISSION POWERLESS.

It is true that the California Railroad (Public Utilities) Commission can prevent the exactions of rates for electric power greater than are necessary to produce a fair income on the value of the property of an electric power company. But, if in the inventory of that property, there appears property in the shape of rights, given away for nothing by the public, to use the water belonging to the people, and if, in addition, as is the case, these property rights, already of enormous value, are rapidly increasing in value, it is evident that a public utilities commission cannot prevent the public being charged enormous sums of money for the utilization of the products of the use of its own property. If, however, the public had never permitted water rights to become private property, it is evident that the public could not be now assessed for the use of that which it gave away into private ownership.

There should be, therefore, the power lodged in some state agency to examine into water rights now claimed as private property and to initiate proceedings, where necessary, looking to the recovery to the public of those water rights which have not legally become private property.

WATER.

Of all the natural resources, there is none more valuable, more necessary to present and future generations of California than water. For domestic use, for navigation, for irrigation and for the generation of electrical power it is essential for the present and future prosperity of this State. From the mountain streams of California there may be developed, it is estimated, upward of 5,000,000 electrical horsepower. At present, the developed power from that source is in the neighborhood of 350,000 horsepower, with new developments constantly being made. Water-generated electricity runs our street cars, operates our mines, lights our streets and buildings, moves our machinery, pumps water for irrigation and other purposes, and is steadily being put to new and more extended uses. It is entirely safe to say that, within the next quarter of a century, electrical energy, developed by falling water, will be used for the commonest activities of everyday life. It will do most of the farmer's work; it will save the housewife much of her present drudgery; it will be necessary in every household and in every activity of our daily lives. It is estimated that 5,000,000 electrical hoursepower are equivalent to the steam power produced by the burning of 100,000,000 tons of coal per annum, worth, at present California prices, at least $1,000,000,000.

The utilization of all of California's water power will save many millions of dollars annually to the people of this State. A monopoly, therefore, of our water-generated electrical power would put the power-requiring industries and the people of this State at its mercy.

WATER-POWER MONOPOLY FORMING.

Already such a state-wide monopoly is in process of formation. Already there are such monopolies in the northern and in the southern part of this State. Such attempted monopolies are, from the very nature of things, inevitable; because more money can be made by combination into larger companies of a number of smaller ones. But the public, of course, does not get its share of the benefits derived from such combinations, although the public has given, for nothing, the use of the water necessary for the profitable operations of these monopolies.

STATE CAN REGULATE MONOPOLIES.

It is true that the State can regulate such monopolies after they are formed. But the regulation will be all the more certain and satisfactory if the water by means of which the electrical power is developed is not permitted to fall unregulated into private control and the right to use it is not permitted to become private property. An ounce of monopoly-prevention is worth a pound of monopoly-cure.

It is also true that large amounts of electricity are generated in California by steam power, with oil and coal as fuel, and that much steam power, especially in railroad locomotives, is generated by means of oil fuel. But oil is not inexhaustible, and cannot be as cheaply produced or transported as electrical energy can be. For similar reasons and because of the coal monopoly coal is high in price. Therefore the price at which electrical power is sold in California is higher than it would be if the use of the water by which it is now generated had not been permitted to become private property.

OVER-CAPITALIZATION OF POWER COMPANIES.

There can be no doubt but that, based upon the private ownership of the right to use water, the capitalizations of many, if not all, of the quasi-public power companies of California have been enormously inflated or "watered," and that the public, from whom the right to use the electricity-generating water was obtained, is, therefore, compelled to pay higher prices for electrical power than would have obtained had the public not given away into private ownership the right to use that water.

PUBLIC OWNS WATER.

Under the organic law, the property right to water itself can not be taken away from the public. But California, from the very beginning of her existence as a State, has permitted the right to use water to become, by appropriation and later by riparian right, private property. The very natural result has been that appropriation rights have been capitalized, and the people, who gave away those rights for nothing, have been compelled to pay to private parties returns upon their ever-enhancing values.

"COLD STORAGING" OF WATER POWERS.

Not only that, but private parties have appropriated, for nothing, the right to use water and have not put that right to any use that is beneficial to the public. Those unused rights, if used, would be valuable to the public. Those who have obtained them consider them as valuable assets, and the public is compelled to pay returns upon those unused rights to use the water belonging to the public.

To illustrate: An electric power company appropriates, for nothing, the right to use a certain quantity of the water belonging to the people. In order to develop electrical power by the use of that water, the company expends a million dollars in pipe lines, dams, ditches, buildings, generating machinery and transmission lines. On that million dollars, the company should, as a matter of course, be permitted to collect even generous returns from the public who use the power generated and transmitted by the company's property. But the company, very naturally, considers that the monopolistic right to use that water, given away for nothing by the people, is valuable—worth, say, another million dollars. The company, therefore, proceeds to collect from the public returns upon two million dollars—one million of actual investment, another million represented by the used water right, which the public gave away for nothing. The public, therefore, is charged double rates for the product of the use of its own water, with the title to which water it never has parted and never can part. And this is not all; for if there be, as there generally are, other water rights which may be used in competition with those already appropriated and put to a beneficial use, the company very naturally proceeds to appropriate them and thus keep them from being used in competition with itself. These other monopolized water rights, given away for nothing by the public, the power company, very naturally, considers as valuable assets. It, therefore, demands that the public shall pay it returns upon that value. The public, therefore, is compelled to pay the company returns on, say, three millions of dollars—one million of actual investment, one million of monopolized, used water rights, one million of monopolized, unused water rights; although the public gave away both used and unused water rights for nothing.

It is true that the law of this State provides that no water right shall become private property unless the appropriator shall, within a certain specified time after he posts his notice of appropriation, commence work upon the project and prosecute the work diligently and uninterruptedly to completion. But nothing has prevented appropriators of the right to use water from holding appropriations, year after year, without doing much, if any, work upon them. Furthermore, as soon as one appropriation lapsed because of a failure to do any work upon it, the same appropriator was permitted to post and file a new notice of appropriation. Thus year after year, a very valuable public asset and natural resource could be, and often has been, kept in cold storage and monopolized without rendering the public, who gave it away for nothing, any benefit whatever.

Furthermore, claiming the right to divert and use water, a rich, and therefore powerful corporation could, without complying with any requirement of the law, scare off any other proposed appropriator by threatening to annoy and harass him in the courts, at great cost of time and money to the bona fide, would-be appropriator. In these ways it was formerly possible, and still is on old appropriations, for the appropriator of the use of water for power and other purposes to monopolize and cold-storage the most valuable, and constantly becoming more necessary, natural resources of this State.

CREATION OF WATER COMMISSION.

The last extra session of the Legislature passed a statute creating a State Water Commission, to which all applications for permission to appropriate the use of water for power purposes shall be made. The same act also limited to forty years the term for which the use of water can be appropriated for such purposes. It also declared to be unappropriated all water or the use of water which has not been put, with due diligence in proportion to the magnitude of the work, to a useful or beneficial purpose.

INADEQUACY OF LAW.

But the act did not give the Water Commission the power to investigate power and other appropriations and determine, with, of course, an appeal to the courts, which appropriations had been exercised in accordance with the provisions of the old law, and which had not been so exercised and, therefore, were null and void. The result has been that many appropriations of the right to use water, which were neither made in good faith nor prosecuted to completion as the law directed, are still being held in cold storage; and those who would, in good faith, reappropriate and put them to useful and beneficial purposes have been scared off from making new appropriations by fear of costly, time-consuming litigation.

The Conservation Commission's bill, by which the method for the appropriation of the right to use water for all purposes is still further defined and rendered clearer, gives the Water Commission the authority to investigate power and other water appropriations made prior to 1911, and to declare, subject of course to appeal to the courts, which appropriations have been and which have not been made and pursued in accordance with the provisions of the old law, under which the appropriations were attempted. The State should assume full control of its property and see that it is, from the very beginning of its use, properly used, and that its use is permitted only to those who can and will use it with a due and full regard for the rights of its owners, the public.

TITLES TO WATER RIGHTS SHOULD BE CLEARED UP.

If the water rights of this State are to be finally, expeditiously and economically cleared up and determined, some agent of the State must be given the authority to go onto the streams, make the necessary investigations and declare, subject to court revision, what water rights are yet free for appropriation. Until that is done, no exact knowledge can be had of the amount of water open to appropriation.

Other states, notably Oregon, have adopted legislation similar to that proposed in the bill formulated by the Conservation Commission and now proposed to the Legislature, as the Act of 1911 directed the Commission to do. The Oregon law gives greater powers to the Oregon Commission than the Conservation Commission's bill proposes to confer upon the California Water Commission. But the Oregon Commission has made nearly 900 determinations as to water rights; and, according to its reports, less than half a dozen of those determinations have been appealed to the courts. The result has been that Oregon water rights have been confirmed upon bases which will render useless any further expensive and time-consuming legal contests concerning them.

The reason for assuming that the Oregon water rights are finally settled by the decisions of the Oregon Commission is that, first, no appeals have been made from the vast majority of those decisions; and, second, because as those decisions having been made as to and accepted by practically all the claimants on certain streams and stream systems, there is nobody left on those streams who has any interest in disturbing the present status. And the same conditions will naturally follow the Commission's work on other streams.

RESULTS OF CALIFORNIA WATER–RIGHTS LITIGATION.

In California, however, water litigation has never settled the rights of any persons other than those parties to each suit. If, therefore, there be one hundred water right claimants on any stream, the rights of each of those claimants can never be finally settled until each claimant sues every other claimant, or until, by some such procedure as the proposed bill provides, the rights of all the claimants are, without any great expense to the claimant, examined into and declared by a commission representing them all.

The right of appeal to the courts being reserved to each and every water-right claimant, the rights of every such claimant will be safeguarded as they are now. But, what is of equal or even greater importance, is that the rights may be speedily and economically adjusted and determined—which, under existing conditions, can not be the case until every claimant on each stream or stream system in California has sued, or has been sued by, every other claimant thereon.

As water rights in this State become more and more valuable—as they rapidly are becoming—the necessity for the speedy, economical and just determination of those rights becomes constantly greater, and in an increasing ratio. Millions of dollars have been spent in water litigation in this State, without settling the rights of anybody except those directly party to the litigation, and then only as between themselves. Many more millions will be spent, in litigation between individuals, without finally settling the rights of each claimant on a stream with regard to all other claimants on that stream, unless and until the State authorizes and empowers somebody to represent all the claimants.

The general public has direct and vital interest in the prosperity of the individual citizen. The general public suffers directly and indirectly when the money, energy, time and hopes of any of its citizens are dissipated in long-drawn out and expensive litigation. The general public and all water claimants have the right to demand that the rights to the use of the property of the public shall be speedily, economically and justly settled and determined. This, as the experience in Oregon has shown, will, the Conservation Commission is convinced, be brought about by the passage of the bill herewith proposed to the Legislature.

OBJECTION TO BILL.

It has been objected to this proposed bill that, because it gives judicial powers to the Water Commission, it is unconstitutional. The Commission, having taken the advice of eminent legal counsel in this regard, believes that the powers proposed to be conferred upon the Water Commission are not judicial, but merely administrative. And in support of its contention the Commission calls attention to the decision of the District Court of the United States for the District of Oregon in the matter of the determination of the relative rights to the waters of the Silvies River and its tributaries, in which the court declares that the Oregon Commission, whose powers are similar to, but greater than, those proposed to be conferred upon the California Commission, are not judicial but administrative.

NO MONOPOLY CREATED BY PROPOSED BILL.

It has also been objected to the bill proposed by this Commission for the regulation of appropriations of water, that it will create, instead of prevent, a power monopoly in this State, because it puts certain conditions and burdens upon power companies incorporated under it which are not borne by such corporations which came into existence under the old law. It is claimed that the fact that, under the proposed law, no power company can gain private ownership of water rights, will enable the old companies to monopolize the field, because they acquired, under the old law, private property rights in the water rights which they are using and enjoying.

The present law provides that no private property rights in water rights for power purposes shall be acquired. And it was quite vociferously asserted, when the bill was being considered by the Legislature two years ago, that its adoption would strike the death knell of power development in this State, and that no further appropriations of water for power purposes would be made under such a law. These prophets of evil were wrong in their prophecies. For, in the year and a half during which the State Water Commission has been in existence, 66 applications for permits to appropriate water have been made to the Board of Control (Water Power) and its successor, the Water Commission, and 14 permits for such purposes have been granted by the Commission. The total expenditures proposed under these approved 14 applications is $6,125,325, and the horsepower to be developed will be 132,648.

It was also strenuously objected to the passage of the act of 1911 that it would act as a deterrent to applications being made by poor men for the right to appropriate the use of water for power purposes. A glance at the report of the Water Commission will at once show that this prophecy, like the former, was a false one, for some of the applications made and the permits granted were for projects requiring the expenditures of small sums of money.

As for the present law or the proposed bill assuring to the old power companies a monopoly of the power markets in this State, the exact opposite is now under the present law and will be the result of the passage of the proposed bill, for such monopolies require the control of the water-right sources of power. And if, as under the old law—all arguments and assertions to the contrary notwithstanding—existing power companies could, by force of legal arms, by threatened law suits, by legal, extra-legal and illegal means, control, with or without using, those water rights which were required by would-be competitors, then they could, as a matter of course, monopolize between them the power markets of this State. And by dividing territory or by directly combining, the old and established power companies could have kept out of the State all competitors.

Under the present law, however, it is rendered impossible for the established companies to appropriate and put into cold storage any water which they had not appropriated and cold-storaged prior to the going into effect of the present law. When, therefore, any person or corporation desires to appropriate water under the present law he has at his disposal all those water rights—and there are many of them—which have not been appropriated and cold-storaged by the old companies, but which, under the old law, could have been appropriated and cold-storaged ahead of the possibility of independent appropriation. The proposed law does not change the present law with regard to the manner in which appropriations of the use of water for power purposes may be made. It simply adds to the State Water Commission's powers the authority to make an inventory of the State's water-power property and to list, so to speak, the appropriated and unappropriated water rights; so that every would-be appropriator may know what rights are unappropriated, and that the Water Commission may know whether or not there is water for the use of any person applying to it for a permit therefor. The proposed bill goes only a step further than the present law in rendering more certain the prevention of power monopoly at the fountainhead, viz., the water powers on the streams of the State.

As for the contention that the prevention of the acquisition of water rights as private property puts or will put the companies having such property in command of the power field in this State, this is conclusively to be said: The present law and the proposed bill provide that water appropriations may be made only for forty years. It is argued that, because they are not compelled to pay off their bonds in forty years, but can redeem the old ones with new issues, the old companies can, therefore, undersell new companies, which would be compelled to lay aside funds for the amortizing of their bonds at the expiration of the term of their license, viz., forty years. Those who make this assertion forget, however, that the old companies have capitalized, and capitalized very heavily, the property rights they have acquired in water rights, and made them the bases upon which enormous issues of stocks and bonds have been made. On these issues of stocks and bonds—these enormous "waterings" of capitalizations—the old companies must pay dividends and bond interest. The new companies are deprived of the power to capitalize as property the rights they have acquired to use the waters of the State—have been so deprived, because they can get no such property rights.

It is, therefore, apparent that the new companies, having no "water" in their capitalizations based upon property in water rights, being compelled to amortize their bonds at the expiration of forty years, will be no worse off, in the matter of charges for what they have to sell, than will be the old companies, which are compelled to charge enough, for what they have to sell, to pay dividends and bond interest on oceans of capitalization "water" based on the enormous and constantly-increasing values of their property rights in water rights.

Nor will the very small and insignificant charges made by the State under the present law, and continued in the proposed bill, serve, as the opponents of the present and the proposed law say it will, to give the old and heavily overcapitalized power companies, which do not have to pay such charges, any advantage over the new companies. These charges are so small that they can be and will be absorbed without adding any burdens to the consumers of power.

PRESENT DETERMINATION OF WATER RIGHTS.

As the California law now is, water rights have been determined, are now and will be determinable only by enormously costly and time-consuming suits between individuals, which settle, as has been said, only the rights as between those who are parties to each suit—leaving the rights as between those who are not parties to such suits undetermined and unsettled until finally determined and settled at the end of a long and costly series of suits.

The Conservation Commission, therefore, believes that it would be a distinctly advanced and very advantageous condition if there were given to the Water Commission, representing the public generally and every water claimant in particular, the authority to examine into and declare, subject to appeal to the courts, the rights of the claimants on the streams of this State to the use of the water belonging to the public.

ANOTHER OBJECTION TO BILL.

Certain individuals and interests oppose the proposed bill, asserting that it would increase, instead of decrease, litigation as to power rights.

In reply to that assertion, the Conservation Commission points to the following facts and considerations: Water rights in this State are rapidly becoming more valuable. The more valuable such rights become, the greater is the temptation, even the necessity, to indulge in costly litigation concerning them. As the law now is only the rights of those who have entered into litigation are settled, and then only as between the parties to each separate suit. There is possible no general settlement of rights on any stream, unless each individual claimant sues every other individual claiming rights on that stream. Under such conditions it lies in the power of individuals to keep water claimants involved in litigation indefinitely.

But if, as has happened in Oregon, the State gives the Water Commission authority to investigate and declare the rights of all claimants upon a stream, with, of course, an appeal to the courts, then, as has happened in Oregon, the interrelated rights of all claimants on a stream may be finally, speedily and inexpensively determined. And, unless some claimant is dissatisfied with the decision of the Commission, there will be no further litigation in regard to those rights—as has been the case in Oregon.

In Oregon, of 865 cases in which water rights were determined by the State Water Commission, only some three or four have been appealed to the courts.

Furthermore, the proposed bill provides that it shall be discretionary with the Water Commission whether or not it shall investigate and determine the rights of water claimants on any stream, even if demands shall be made that it shall so investigate and determine. It is, under the provisions of the bill, for the Commission to determine whether or not the public good will be subserved by the making of such investigation and determination. This provision of the bill, the Conservation Commission feels sure, will further tend to restrict water litigation in this State.

As the proposed bill recognizes ''vested and existing rights'' it will, instead of promoting litigation, the Conservation Commission believes, practically prevent further water litigation in this State, as the decisions of the Oregon Commission have practically done away with water litigation in that State.

WATER RIGHT TITLES SHOULD BE SETTLED.

The titles to water rights in this State should be as finally established and determined as are the titles to real estate. The titles to our real estate date back to and are determined by the soundness or unsoundness of the titles of the original private owner thereof. Those original titles were judicially determined long ago. But there never had been any method, and there is no method now, by which the titles to the use of water can be quickly, inexpensively and finally determined. Real estate would now be in the same condition if the title to it had not been determined by wholesale long ago. The owner of real estate gets title to a definite quantity of land; and the existing quantity of that land never varies. But the right to use water is hedged about with so many necessarily varying conditions of demand for a constantly varying amount thereof, that, until the right of every claimant, as compared with that of every other claimant, on each stream has been settled and determined, litigation over water rights will always be imminent and unavoidable.

Until water rights are determined from a wholesale standpoint, water right titles in California must remain unsettled and the possessors of the longest purses can indefinitely harass and annoy those whose purses are not so long.

RIPARIAN RIGHTS.

There is in this State a modified doctrine of riparian rights. Under such rights, proprietors of riparian lands are permitted to require that all the waters of a stream, on which their riparian lands are situated, shall flow to their riparian lands, excepting such waters as may have been acquired, by five years prescriptive use, by appropriators, or have been used by superior riparian proprietors.

Land flooded by waste water, near Los Banos, California.

The result of this is that enormous quantities of water, which might be, and ought to be, put to some beneficial use are permitted to run to waste into the ocean without doing anybody any good, and in districts subject to flood doing great harm.

There are, therefore, in this State, on the one hand, hundreds of thousands of acres of semiarid and irrigable lands, and of overflow lands on the other hand, which, because of the wasteful exercise of the right of riparian proprietors cannot be cultivated and are, therefore, of comparatively little use to the people of California. The Conservation Commission and all others who desire to see the water resources of California developed and used for the benefit of the people, look with the greatest disapproval upon this right and privilege of the riparian proprietors to waste and turn into a devastating element a most valueable natural resource.

NATURAL RESOURCES SHOULD BE USED.

The Conservation Commission does not care who uses our natural resources, so long as they are used, not wasted, not destroyed, and not hurtfully monopolized. The Commission cares not who uses the waters of this State, the appropriator or the riparian proprietor, so long as they are put to a useful and beneficial purpose by somebody. If the riparian proprietor will not or cannot put to a beneficial use the water that flows down to his land, the Conservation Commission is firmly of the opinion that he should be compelled to permit somebody else to use it—he should not be permitted to let it go to waste and become a nuisance.

Land swamped by waste water from canals in and about Los Banos, Merced County.

MISUSE OF RIPARIAN RIGHTS.

Neither should the riparian proprietor be permitted to put all his riparian water to an entirely inferior and unnecessary use, to the exclusion of many others who, by appropriation, could put some of it to a far superior use. One large riparian proprietor for instance, in the San Joaquin Valley, floods his almost limitless cattle pastures with unnecessarily enormous quantities of water, and does not permit even the excess to be used on the irrigable lands of others, where its use would be of great value to those others and therefore to the State.

A tithe of that water put upon that riparian land would produce the same amount of grass, for cattle pasture, that the tremendously wasteful use of the water now produces. Because of such wasteful use of the water on those riparian lands, there are many thousands of acres of other semiarid, irrigable and fertile lands, which, because they can not be supplied with the excess water which the riparian proprietor allows to run to waste, are nowhere near so productive or valuable as they could be made to be if this wasted excess-water were allowed to be put upon them.

RIPARIAN DOCTRINE NOT APPLICABLE TO CALIFORNIA.

The riparian doctrine is not and never was applicable to the arid and semiarid lands of California. It is applicable only to such humid climates as that of England, where it originated, and where the streams, not being useful for irrigation, are used only for navigation, drainage, fisheries, domestic use, and other similar purposes.

RIPARIAN DOCTRINE NOT STATUTORY.

Neither was the riparian doctrine in this State the result of direct legislative action. It was made the law by the adoption of the common law, and is one of many similar instances where the courts have stepped outside of their prescribed rights and have invaded the rights and prerogatives of other departments of the government of the States and the Nation.

RIPARIAN RIGHTS VESTED.

The Conservation Commission endeavored to find some way by which the Legislature could compel the riparian proprietors of this State either to reduce their rights to use riparian waters to actual practical use or to permit someone else to do so—in other words, to cease wasting one of the most valuable natural resources of this State—so long as there is a pressing and clamorous demand for use of the excess water on lands other than those of the riparian proprietors. But the Commission was assured by eminent legal advisors that, as the Supreme Court had conferred riparian rights upon riparian proprietors, those rights were vested property rights of which the holders can not be deprived unless compensation be made therefor. There appears to be but one way in which these riparian proprietors may be compelled to part with their right to waste the waters of our streams—and that is by condemning those rights and making jury-determined compensation for them.

MODIFICATION OF RIPARIAN DOCTRINE.

Later decisions of the Supreme Court, however, seem to show a tendency on its part to modify its previous declaration to the effect that the rights of the riparian proprietors are higher and more sacred than those of any other class of our people. In an article in the *California*

Law Review for November, 1912, Mr. S. C. Wiel quotes from the decision of the Supreme Court—*San Joaquin etc. Co.* vs. *Fresno Flume, etc. Co.*, 158 Cal. 626—as follows: "The fair apportionment and economic use of the waters of this State are of the utmost importance to its development and well being. The problems presented never came within the purview of the common law. They have been of necessity, therefore, and must continue to be solved by this court as cases of first impression, and as in the past, so in the future, if a rule or decision at common law shall be found unfitted to the radically changed conditions existing in this State, so that its application will work wrong and hardship rather than betterment and good, this court will refuse to approve and follow the doctrine."

Mr. Wiel also quotes from *Gallatin* vs. *Corning Irrigation Company*, 44 Cal. Dec. 169, as follows: "Storm or flood water in a stream does not pertain to the riparian right, if diversion thereof to distant lands will not impair riparian lands, and the ruling permits such diversion against any riparian opposition." And the court also says concerning decisions in preceding cases, that: "These decisions, in effect, establish the just rule that flood waters which are of no substantial benefit to the riparian owner or to his land, and are not used by him, may be taken at will by any person who can lawfully gain access to the stream, and conducted to lands not riparian, and even beyond the watershed, without the consent of the riparian owner and without compensation to him. They are not a part of the flow of the stream which constitutes 'parcel' of his land, within the meaning of the law of riparian rights."

It requires but a step more to be taken by the court for it to be held that riparian owners cannot forever either waste the normal flow of streams or prevent that portion of it which they cannot or will not themselves use from being used by other parties.

The Conservation Commission regards it as extremely unfortunate for California, that any person should have it in his power to demand and require that so valuable a natural resource as water, which is so necessary to the immediate and future advancement and prosperity of this State, should be permitted to run to waste because of the court-conferred right to permit such waste.

STATE MIGHT CONDEMN RIPARIAN RIGHTS.

The Conservation Commission is of the opinion that the State of California could well afford to condemn and, if necessary, pay for these riparian rights and permit the water, thus made available for highly beneficial uses, to be appropriated and put upon the many thousands of acres of fertile lands where it is now so much needed. In the opinion of the Commission, the State, having through its agent, the Supreme Court, given to riparian proprietors these rights, the State could well afford to take them back and compensate their present owners for them. The result of such action on the part of the State would be the creation of a vast amount of new wealth and a greater prosperity for millions of present and future California citizens.

UNDERGROUND WATER.

Underground waters are, in California, of very great value for irrigation purposes, especially in those large sections of the State where irrigation from streams is not easy or cheap. From this underground source much irrigation water is being drawn and still more will, in steadily increasing amounts, be drawn. In the San Joaquin and Sacramento valleys and, especially, in southern California is the subject of underground water receiving attention. The subject-matter is, however, so vast that the Conservation Commission felt that it had neither the time nor the funds necessary to make a satisfactory investigation of it. The question of replenishing, by artificial means, underground water supplies, so that they might furnish greater amounts of water for irrigation, seemed to be within the ability of the Commission for investigation. It, therefore, secured the services of Mr. Charles H. Lee, of the U. S. Geological Survey, to examine and report on the results obtained from such an artificial replenishing of underground waters in the San Bernardino Valley where the winter floods of at least one stream are thus stored. Previous to this artificial, subterranean storage of the waters of this stream, its winter floods not only ran to waste into the ocean, but also did more or less damage. It is practically certain that there are other large areas of this State in which similar artificial, subterranean storage of water for irrigation purposes may be made. Mr. Lee's report will be found attached hereto.

APPROPRIATION OF UNDERGROUND WATERS.

There being no statute law in this State regulating the right to appropriate and use underground waters, such rights have been so far regulated only by court decree. Such method of regulation, the Conservation Commission believes, is not the best method. It should be by well considered statute laws. The Commission does not hesitate to predict that, as the rights to the use of surface waters have been the subject of long continued and very costly litigation in this State, because of the absence of proper statutory regulation of such rights, so, in the absence of proper statute law concerning it, the rights to appropriate and use underground water will be the subject of constantly increasing litigation between those to whom it is becoming, with constantly increasing rapidity, more necessary, and, therefore, more valuable.

CAREY ACT.

There are in this State large areas of semiarid lands that can be irrigated and made highly productive by irrigation. A superficial investigation has led the Conservation Commission to the belief that, under the provisions of the Carey Act of Congress, large areas of this State may be transformed from deserts or practically deserts into most highly productive farms. The provisions of the Carey Act are as follows:

TEXT OF CAREY ACT.

"That to aid the public land States in the reclamation of the desert lands therein, and the settlement, cultivation and sale thereof in small tracts to actual settlers, the Secretary of the Interior with the approval of the President, be, and hereby is, authorized and empowered, upon proper application of the state to contract and agree, from time to time, in each of the states in which there may be situated desert lands as defined by the act entitled "An act to provide for the sale of desert land in certain states and territories," approved March third, eighteen hundred and seventy-seven, and the act amendatory thereof, approved March third, eighteen hundred and ninety-one, binding the United States to donate, grant and patent to the State free of cost for survey or price such desert lands, not exceeding one million acres in each state, as the state may cause to be irrigated, reclaimed, occupied, and not less than twenty acres of each one hundred and sixty-acre tract cultivated by actual settlers, within ten years next after the passage of this act, as thoroughly as is required of citizens who may enter under the said desert land law.

Before the application of any state is allowed or any contract or agreement is executed or any segregation of any of the land from the public domain is ordered by the Secretary of the Interior, the state shall file a map of the said land proposed to be irrigated which shall exhibit a plan showing the mode of the contemplated irrigation and which plan shall be sufficient to thoroughly irrigate and reclaim said land and prepare it to raise ordinary agricultural crops and shall also show the source of the water to be used for irrigation and reclamation and the Secretary of the Interior may make necessary regulations for the reservation of the lands applied for by the states to date from the date of the filing of the map and plan of irrigation, but such reservation shall be of no force whatever if such map and plan of irrigation shall not be approved. That any state contracting under this section is hereby authorized to make all necessary contracts to cause the said lands to be reclaimed, and to induce their settlement and cultivation in accordance with and subject to the provisions of this section; but the state shall not be authorized to lease any of said lands or to use or dispose of the same in any way whatever, except to secure their reclamation, cultivation and settlement.

As fast as any state may furnish satisfactory proof according to such rules and regulations as may be prescribed by the Secretary of the Interior, that any of said lands are irrigated, reclaimed and occupied by actual settlers, patents shall be issued to the state or its assigns for said lands so reclaimed and settled: *Provided*, That said states shall not sell or dispose of more than one hundred and sixty acres of said lands to any one person, and any surplus of money derived by any state from the sale of said lands in excess of the cost of their reclamation, shall be held as a trust fund for and be applied to the reclamation of other desert lands in such state. That to enable the Secretary of the Interior to examine any of the lands that may be selected under the provisions of this section, there is hereby appropriated out of any moneys in the treasury, not otherwise appropriated, one thousand dollars."

ALL WATER RIGHTS SHOULD BE REGULATED BY THE STATE.

Water for all purposes, irrigation as well as power, is rapidly becoming more necessary to the proper and full development and habitability of this State. The State, therefore, is vitally interested in seeing to it that the old slipshod and unsatisfactory methods, under which any person could appropriate and put or not put the waters of the State to beneficial use, shall be displaced by a more satisfactory and determinative method for the regulation and control of water appropriations. The appropriation of water for power purposes has already been put under State regulation, and the would-be appropriator must submit his proposal to appropriate to the Water Commission—he is no longer permitted to initiate such appropriations simply by posting and recording a notice—he is no longer permitted to file one appropriation on another far beyond the capacity of the stream to furnish the water even previously appropriated. There is now a State authority to see to it that appropriations for power purposes are made in good faith and carried out in good faith; and that, when good faith in either particular is wanting, the attempted appropriation is voided and annulled. But there is no power lodged in any State agent to clear out of the way appropriations for power purposes made under the old law and not carried on with the good faith required by that old law.

Appropriations of water for power purposes are, however, of no greater importance to this State than are appropriations for irrigation purposes. With regard to irrigation appropriations the old law still prevails. Any person may post and record his notice for new irrigation appropriations, whether or not there is enough unappropriated water in the stream to satisfy even previously made appropriations. And having, in this slipshod and faulty manner, made his appropriation, the appropriator must, even if he be in good faith, find out for himself whether or not there is, or will be, enough water in the stream, unclaimed by previous appropriators or riparian proprietors, to satisfy his needs. If, on the other hand, such an appropriator be not in good faith, he can, under the law as it now is, make his irrigation appropriation and sit down upon it, until, at great expense of time and money, he shall be dispossessed of it by some private individual.

Overflow water from ditch near Los Banos, Merced County.

"CAVEAT EMPTOR" DOES NOT APPLY.

"Caveat emptor" may apply well where only individuals are the parties in interest. But the whole people of this State are vitally interested in seeing to it that no appropriative water monopolies are created, and that any unused portion of this invaluable natural resource shall be at the disposal of those who, in good faith, desire to appropriate and use it. The State should allow none of it to be held unused in cold storage.

STATE AGENCY NECESSARY.

The monopoly of irrigation water is not so easily accomplished as water monopoly for power purposes. But water for irrigation is necessary for the rapid population of a very great portion of the State. And, as the population of any portion of the State grows more dense, the need of water for irrigation purposes grows more intense and its value, therefore, always greater. It is necessary, therefore, that in the case of water for irrigation, as well as power, purposes, there should be some agency of the State to which would-be appropriators of water for irrigation purposes must apply, in order that there may not be confusion worse confounded in the matter of these appropriations. That State agency should also have the authority to examine and investigate the appropriations that have already been made, and, subject, of course, to court determination, find out what appropriations have been made in compliance with the law. In this way, and in this way only, can the titles to water rights be cleared up and long-drawn out and enormously expensive litigation over irrigation water rights be avoided. The litigation, costing millions of dollars, and, in not a few cases, stopping for many years the development of large sections of this State could have been avoided had the State had some agent through whom the steps preliminary to the actual putting to use of water should have been referred.

SETTLED WATER RIGHTS NOT DISTURBED.

In those portions of this State where the rights to the use of water have been finally determined and accepted by everybody, there is no crying necessity for the exercise of any State supervision in the matter of the rights already finally determined and universally accepted. And in such cases no State agency could or ought to interfere. But these final determinations of water rights have been made only after long and expensive litigation by individuals. Appropriators in those portions of this State where water rights have not yet been finally determined and accepted should not be put to the same private expense for the purpose of determining water rights. For their purposes, if for none other, the State should have an agency to which would-be irrigation appropriators should apply, and to which the power has been delegated to examine into, where necessary, the bona fides of appropriations already made or attempted.

STATE SHOULD KNOW HOW MUCH WATER UNAPPROPRIATED.

Before the State should attempt to grant a right to appropriate and use any of its water property, it should know how much of that property, not being already put to a beneficial use, is appropriatable and may be put to other beneficial uses. Before the State can give a permit, that really means anything to the permittee, to use any of its water property it must know how much of that property it has at its disposal to grant under such permits. If the State has not such knowledge, its permits are of uncertain value, and the holders of them are compelled to take all the risk involved by other adverse possessory rights. It is, therefore, necessary for the State to know, not only what water has already been put to beneficial uses for power purposes, but also what waters have been appropriated for all other purposes. The present slipshod, haphazard method of appropriating water for irrigation purposes and the former slipshod and haphazard method of appropriations for power purposes have led to a condition of affairs where the last would-be appropriator, either for power or irrigation, must proceed to divert his water in the face of a possible lawsuit; or, having gotten his permit, finds that the permit is useless because all the water in that particular stream has already been appropriated; or, in order to protect himself, must buy off the holder of a shadowy, unperfected prior right to the use of water, which right, however, is of sufficient validity to support a law suit. All these troubles can be, ought to be, avoided if the State is to protect and regulate, as it should, the right to use its waters. It is, of course, impossible for the State to do that, unless it knows what valid appropriations and other rights are in existence.

LAND TITLES PROTECTED.

Real estate titles are protected by public records which are recognized by the courts and which give a minute history of the title to every parcel of land. There should be an agency of the State through which the titles to water rights may be at least equally well defined and settled; and the right to appropriate water, for any purpose should no longer be left to the desire, bona fide, speculative or otherwise, of the individual, expressed simply by the filing and recording of a notice, with no agency of the State whose business it is to supervise the transaction at any point.

"BULLETIN 100" ON NECESSITY FOR STATE REGULATION.

The unnecessary danger, inconvenience, law suits, expenses and other annoyances, some of them very serious in their results to individuals and even communities, resulting from the absence in this State of any central state agency with authority to initiate proceedings to straighten out existing water right tangles and to prevent others from being created, are well described and commented on in the famous and authoritative ''Bulletin 100,'' issued by the U. S. Department of Agriculture, in 1901. This bulletin referred especially to California conditions, and was written and compiled under the direction of the following well-known Californians: Professor C. D. Marx, then and now of Stanford University and the present chairman of the State Water Commission of California; Professor Frank Soule, then and now of the University of California; C. E. Grunsky, formerly a member of the Panama Canal Commission and the San Francisco Water Commission; Marsden Manson, formerly City Engineer of San Francisco and a member of its Water Commission; James D. Schuyler, the eminent hydraulic engineer, and Messrs. James M. Wilson, Edward M. Boggs, and William E. Smythe.

QUOTATIONS FROM "BULLETIN 100."

Mr. Elwood Mead, the great irrigationist, formerly of the U. S. Department of Agriculture, now head of the Department of Irrigation of Australia, speaking of the necessity for State control of the waters of this State, in "Bulletin 100," page 54, said:

"California also needs a law which will stop all further claims to water where the entire supply is now appropriated. Every ditch which can not be filled, every pump which can not be operated, every acre of land prepared for irrigation which is in excess of what the stream will serve, means either a loss of the money invested or the robbing of an earlier user; sometimes it means both. So long as the right to make new appropriations is unrestricted, so long will old rights be insecure." * * *

"The advantages of public control which would restrict the construction of additional works until it had been demonstrated that there was water for their use and provide for a just division among the works already in existence seemed so obvious that I sought from those directly interested an explanation of why an attempt had not been made to secure it. The reply in every case was practically the same. All classes of water users and water claimants united in saying the state government did not offer any prospect of remedy and that they could not afford to take any chances but preferred to come to an agreement among themselves."

"It is not believed that this fear is well founded. It would take remarkably corrupt officials to create evils equal to those now existing. The notion that we must have human nature reformed and all the state machinery perfected before anything is done toward the regulation of streams is certainly erroneous. That any sort of system will remedy all these evils, or entirely avert controversies, is not expected. No matter how efficient a code of laws may be devised, or how honest and efficient their administration, there is certain to be friction because of the conflicting views created by the unfortunate absence of definite control in the past."

Speaking of the reports of Messrs. Grunsky, Smythe, Soule, and Judge Works, which show that water litigation, costing millions of dollars, have settled only the interrelated water rights of individuals, but have not settled the water rights of those not parties to the suits, Mr. Mead (page 61, "Bulletin 100") says:

"The showing made by these official records is referred to in order to make clear that the State has a duty toward these creators of wealth which it is not discharging so long as it leaves any of them in doubt as to what is their just share of the river's flow, and puts upon them the entire expense of securing that share. Appropriators of water ought not to be subjected to the expense of protecting their rights. That is a duty of the Government and should be paid for by public taxation. It is the only way in which impartial justice can be assured. Leaving the ownership of streams to be fought over in the courts and titles to water to be established in ordinary suits at law has never resulted in the creation of satisfactory conditions and never will. As it now is the same issues are tried over and over again. Each decision, instead of being a step toward final settlement, too often creates new issues which in turn have to be litigated. The suit of one canal company against another company may settle the rights of these parties as against each other, but it settles nothing with respect to other appropriators not made parties to the litigation and the whole controversy may be opened up at any moment. A stream with three appropriators has the foundation for at least three lawsuits: A *vs.* B, A *vs.* C, and B *vs.* C. If there are four appropriators the way is open for six adjudications. Often the appropriators of a stream are numbered by scores and even hundreds. It might be interesting to compute the number of legal conflicts necessary to a judicial determination of the relative rights on streams like the Yuba, and these will, under the present procedure, increase with the years because there will be new appropriations and old ones will be extended. It is not surprising that the petition for this investigation should state that the litigation is appalling. It could not be otherwise. Litigation is as natural a product of the absence of public control as are weeds in a neglected field."

"There can be no stability under the present situation. The law affords no means of enforcing a right when once adjudicated except through another lawsuit. Irrigators can not live in peace. Litigation and controversy are forced upon them.

To acquiesce in a new diversion, through sympathy, or for the sake of peace, may lay the foundation for an adverse right by prescription and end in the curtailment or the overthrow of all the rights of the peace lover. This uncertainty and the fear of being supplanted which grows out of it is the cause of much of the hostility with which appropriators regard new ditches, and is the motive behind much of the extravagance and waste which sometimes prevail in the use of water. With a right clearly defined and protected, its owner has no fear of shortage in time of need, and he is willing, when his crops do not require water, to have it utilized by others. But when the right is insecure or not defined the instinct of self-protection makes an Ishmaelite of every water user. His hand must be against every man, as every man's hand is against him. Duty to himself and to those dependent on him makes it necessary that he shall use all means at his command to discourage the establishment of rights which may later interfere with his necessary use of water. Under such a system every new appropriator is a new element of uncertainty and another menace to the peace of the community. The whole system is wrong. It is wrong in principle as well as faulty in procedure. It assumes that the establishment of titles to the snows on the mountains and the rains falling on the public land and the waters collected in the lakes and rivers, on the use of which the development of the state must in a great measure depend, is a private matter. It ignores public interests in a resource upon which the enduring prosperity of communities must rest It is like A suing B for control of property which belongs to C. Many able attorneys hold that these decreed rights will in time be held invalid, because when they were established the public, the real owner of the water, never had its day in court." * * * *

"Under a rational irrigation code titles to water are established like titles to public land, by proceedings which are wholly ministerial. This is the case under the Northwest irrigation act of Canada, and under the Wyoming irrigation law, where the supreme court recently held that even in determining territorial rights the state board of control acts as an administrative and not as a judicial body. (*Farm Investment Co.* vs. *Carpenter*, 61 Pac. Rep. 258.)"

"If the amount of an appropriation depends upon the volume of water beneficially used, the first step in the determination of a water right should be a physical investigation. The water supply should be measured, the capacity of the ditch which diverts it should be determined, and the area and location of the land on which the water has been used defined. With these facts before it, the tribunal which fixes the amount of a water right has only a problem in mathematics. The judicial element is no more present than it is in fixing the taxable value of a horse or cow, in passing upon an assessment schedule, or determining whether or not a homesteader has complied with the land law. Determining the amount of water used is no more a judicial act than the fixing of a tax rate by a board of supervisors, the leasing value of land by a board of land commissioners, or hundreds of other acts of official and everyday life which require the exercise of ordinary judgment and discretion. One of the most mistaken and injurious beliefs is that rights to water can be settled only through a lawsuit. Nevertheless, the opinion seems to prevail widely, not alone in California but throughout the arid region, that water is a kind of property which must be disposed of exclusively by the courts."

PRESENT WATER TITLES NOT ABSOLUTELY SURE.

Especial attention is called to that sentence of Mr. Mead's report, in which he says: "Many able attorneys hold that these decreed rights will in time be held invalid, because when they were established the public, the real owner of the water, never had its day in court." In other words, the people of California own the water of this State. If, then, A sues B for the settlement of a water right and gets a judgment confirming to him the right to use a certain amount of water, that judgment confers title to A only as regards B, but has no binding force with regard to C, D, E, or F, none of whom was party to the suit or had his day in court with regard thereto. So C, D, E, and F can each sue A, and be sued by each other. But, in none of the suits for the settlement of water rights in California has the public, the real owner of the water, been made a party, or had its day in court. So, after A, B, C, D, E, and F have each sued, and been sued by, the other, and have received judgment, or have divided, by agreement among themselves, the waters of a stream, the public, the real owner of the water, against whom the statute of limitations does not run, may step in and, suing them all, take from them their costly litigated water rights, on the ground that it, the real owner, never having had its day in court, is not bound by any of the preceding litigation, to which it was not a party.

It, therefore, appears that, in order to assure their titles to water, all present users of it, as well as all those who may appropriate it, ought gladly to welcome the appearance of the State in the settlement, adjudication and determination of past, present and future water rights. The bill proposed herewith, following the general lines which have worked so well in other states, provides, in the State Water Commission, an administrative body through which the legal tangles of present water rights may be straightened out and future tangles prevented.

INVESTIGATION OF WATER LOCATIONS.

In September, 1911, in conjunction with the Board of Control (Water Power) the Commission began an investigation of all locations (under sections 1410 to 1422, C. C.) of water for power purposes. Agents were sent to every county in the State to make an abstract of the location notices. These abstracts, aggregating about 30,000 in number, are part of the records of the Water Commission. A card index to streams with a cross reference to the name of the appropriator has been prepared and is on file in the office of the Commission, so that any location notice may be easily found. Five graduate civil and hydroelectric engineers were employed by the State Water Commission to investigate conditions on certain streams, principally to determine the amount of development work performed by the locators of water rights under the old method of appropriation. These men examined about fifteen hundred appropriations situated in Plumas, Butte, Tehama, Shasta, Yuba, Sacramento, Yolo, Tuolumne, and Inyo counties. It is apparent from the investigations made and statements secured by the engineers from residents in the vicinity of the point of diversion of the respective locations that fully ninety per cent of the 1,500 investigated were made only for speculative purposes. Many water locations have been held for years in plain violation of the spirit and letter of the law, without sufficient work being done upon them to show a bona fide intention to divert water for a beneficial use.

ILLEGAL APPROPRIATIONS SHOULD BE VOIDED.

The Conservation Commission believes that such claims should not only be declared null and void, but that the water rights held under them should be restored to the public control, so that they may be located by others and used.

It is true that any individual who wants to use the water now held in illegal cold storage under these voidable, but not voided, locations may do so. But, in order to do that, the individual is compelled to bring suit and expensively litigate the matter through the Supreme Court. Nobody will do that until it becomes actually necessary. The result is that much water is being kept in cold storage, being neither used by those who hold it, nor its use permitted by others.

WATER IS PUBLIC PROPERTY.

Water being the property of the public and its use being valuable to the public, the State should see to it that all unused locations should actually be specifically declared null and void and the water restored to public control. A valuable natural resource like water should not be allowed to be kept in cold storage; and no individual should be compelled to go to the annoyance, trouble and expense, in time and money, necessary to the declaration by the State that the State's property is being held in cold storage in contravention of public policy and the law. It is true that the law declares such water locations null and void. But no agency of the State has been given authority to investigate these locations and bring any sort of a proceeding looking to their actual annulment. The bill proposed by the Conservation Commission proposes to supply this deficiency and to give to the Water Commission the authority to initiate such proceedings.

NOT SOUND PUBLIC POLICY TO PERMIT "COLD-STORAGE" OF WATER.

It is claimed, to be sure, that those who have made such locations and, under them, are keeping valuable water rights in cold storage should be permitted to continue to hold them until some other individuals sufficiently desire possession of them to induce them to bring the necessary suits and spend the necessary money to obtain a final annulment of them. The Conservation Commission does not believe that it is sound public policy for the State to permit anybody to break and continue to break the law. Nor does the Commission believe that it is sound public policy to permit anybody to cold-storage a natural resource so essential to the public welfare as water is. And the Commission also believes that it is not sound public policy for the State to compel individuals to spend their time and money to take public property out of cold storage and make it available for the use of the public.

Rather than enter into long and costly law suits for the restoration to the public's use of cold-storaged water rights, many persons and corporations have paid the illegal holders of such rights large sums of money to relinquish or transfer them. Such expenses the public is, of course, made to repay to those who incur them. The Conservation Commission does not believe that the public should be compelled to pay this cost of blackmail for the enjoyment of the use of its own property. The public should be protected from this sort of thing by the empowering of an agent of the State to restore to the public all water locations which have not been or are not being developed and put to use as the law plainly requires that they shall be.

APPROPRIATORS SUPPOSED TO KNOW LAW.

It is claimed that this will work hardships upon those who made the locations. The locators are supposed to have known the law when they made their locations and not to have forgotten since then what the provisions of the law are. They, therefore, exercised their location rights with a presumably full knowledge of the law and their obligations under the law, and are attempting to hold the property of the public knowing that they are breaking the law. The Conservation Commission does not believe that it is good public policy to suspend the law because its enforcement may work supposititious hardship upon him who is knowingly or even unknowingly breaking the law.

PUBLIC SHOULD BE PROTECTED.

Finally, the Conservation Commission does not believe that it is good public policy to compel the public to pay any more for the enjoyment of the use of its property than is actually necessary to provide the artificial means to put that property to a beneficial use. The right to use the property of the public for the public's benefit should not, the Conservation Commission believes, be permitted to become, at the cost of the public, the subject of private speculation by illegal or even legal means.

For all these reasons, therefore, the Conservation Commission insists that the State should empower the Water Commission to initiate proceeding for the annulment of illegal appropriations of the waters of the State.

WATER LAWS OF OTHER STATES AND COUNTRIES.

As it was necessary for the Commission to have at hand a digest of the laws of the various nations and the states of the Union in regard especially to forestry and water laws, Mr. Milton T. U'Ren, then in the city of Washington and therefore able to avail himself of the Congressional Library, was employed to collect these data for the Commission. His final report is as follows:

FINAL REPORT OF THE INVESTIGATION OF THE STATUTES, LAWS AND CONSTITUTIONAL PROVISIONS RELATING TO WATER AND WATER POWER.

In presenting this final report of the investigation of existing legislation pertaining to water and water power I shall set forth the scope of the field covered and shall give a brief summary of previous reports rendered.

In the United States the efficient regulation of the use of water must come from the several states. The Federal control is merely incidental. The Federal Government exercises control through its power over navigable streams and as the owner of the public domain. The Federal Government has no laws dealing directly with water and water power. It exercises control indirectly through the departments. Through the War Department it exercises control over navigable streams. It has been the practice to require as a condition of any grant to obstruct navigable streams or to use the water thereof that the grantee conform to certain provisions set forth in the grant. Acts of Congress granting the right to dam navigable streams or to divert their waters have many times likewise contained conditions giving the Federal Government the right to control the use of the water or water power resulting therefrom. The Bureau of Forestry of the Agricultural Department controls the construction and operation of water power plants on the Federal domain, but fixes certain conditions to the grants permitting individuals to use the public domain. These practices of the Federal Government have been severely criticised by those claiming a desire to develop the country, but in the absence of state laws on these subjects the actions of the Federal officials have been the only thing standing between the public and the complete gobbling up of all reservoir sites by private speculators. No doubt a plan of coöperation between the Federal Government and the states will be worked out which will permit the development and use of water and water power sites on the Federal domain as rapidly as is required by the public.

In examination of the state laws I find that there are eighteen states which are known as irrigation states. This designation comes from the fact that irrigation is a necessity to farming operations. The laws regarding water in those states have therefore of necessity been more highly developed than the laws of the other states. I have carefully gone over the laws of each of these states indexing them and have filed the same with the Commission under the card index system. In doing this I have presented one thousand six hundred and twenty-five cards.

This card index has been arranged in such form that anyone desiring to ascertain the law, or any particular feature of the water laws, of any particular state can find it by turning to the subject upon the card index.

The complete result of the investigation of the laws of the eighteen irrigation states has been set forth by me in a chart already filed with the Commission. This chart gives the names of the eighteen irrigation states, sets forth the particular phases of the laws in operation in each state and refers specifically to the statutes and constitutional provisions of that state. In presenting the result of my investigation of the laws of the states to the Commission I have done so in the form of five briefs.

Brief No. 1 is "A General Discussion of the Laws of the States Regarding Irrigation and Water Power." Brief No. 2 is "The Law of California Regarding Water and the Use of Water." Brief No. 3 is "The Doctrine of Riparian Rights and its Relation to Modern Conditions." Brief No. 4 is "The Law Regarding Water Power." Brief No. 5 is "The Control and Regulation of Water and the Use of Water."

Brief No. 1 contains a short history of irrigation, and describes the growth of the subject and the legislation enacted in the irrigation states. It sets forth what states have a system of state regulation of appropriation, what states have a method of adjudicating priorities, and what states have a system of administrative control over water rights.

Brief No. 2 deals with the laws of California regarding water and the use of water. It sets forth the Code sections upon the subject and gives a history of the growth of water rights and the growth of the doctrine of appropriation in the state. It cites and discusses the court decisions interpreting the Code sections. It also discusses the adoption of the doctrine of riparian rights by court decisions.

Brief No. 3 deals with the doctrine of riparian rights. It discusses the origin of the doctrine dating from civil law and the common law and sets forth its growth as a common law doctrine through three stages. The introduction of the doctrine of riparian rights is taken up and discussed, together with the successful efforts to limit its scope. Its nature and its effect upon the development of the West is discussed.

Brief No. 4 deals with the laws relating to water power. It shows that this is a new subject and is one of recent growth. The two states most prominent in dealing with the question are Wisconsin and New York. The Wisconsin law has been declared unconstitutional by the Supreme Court. In New York a law is now pending having been proposed by the Water Commission after years of study. This is a new field and California may perhaps have the distinction of leading the way.

Brief No. 5 entitled, "The Control and Regulation of Water and the Use of Water" deals with the question as to State and Federal control. The statutes and court decisions are discussed, and the conclusion reached that the state is the owner of the water and is the proper authority to give most efficient control. The existing laws dealing with the control of water and water power are discussed and recommendations made for their betterment.

The laws of foreign countries I have investigated, and have compiled the laws of the following countries: France, Italy, Spain, Egypt, Australia, and Canada. These have been card indexed. The provisions of the Australian laws are perhaps most instructive as they have been drafted and put into force by Elwood Mead, former irrigation investigator for the Federal Government, and the author of the Wyoming water laws.

The principal lesson to be gained from the irrigation countries of Europe is the necessity for a central control. Either the use of water is controlled through a strong central organization of those using it, or by the government. The government being the stronger power has exercised the most successful control.

The result of these investigations has led me to the conclusion that the Oregon water law is probably the best as yet devised for modern conditions. The most immediate and pressing need is for authority to be granted to some Commission for the purpose of determining existing rights subject to confirmation by the Courts. This is the Oregon plan and it worked out admirably.

Respectfully submitted.

(Signed) MILTON T. U'REN.

The card index, the chart and the briefs referred to above, are on file in the office of the Commission and are available for inspection.

PUBLICATION OF OTHER WATER DATA.

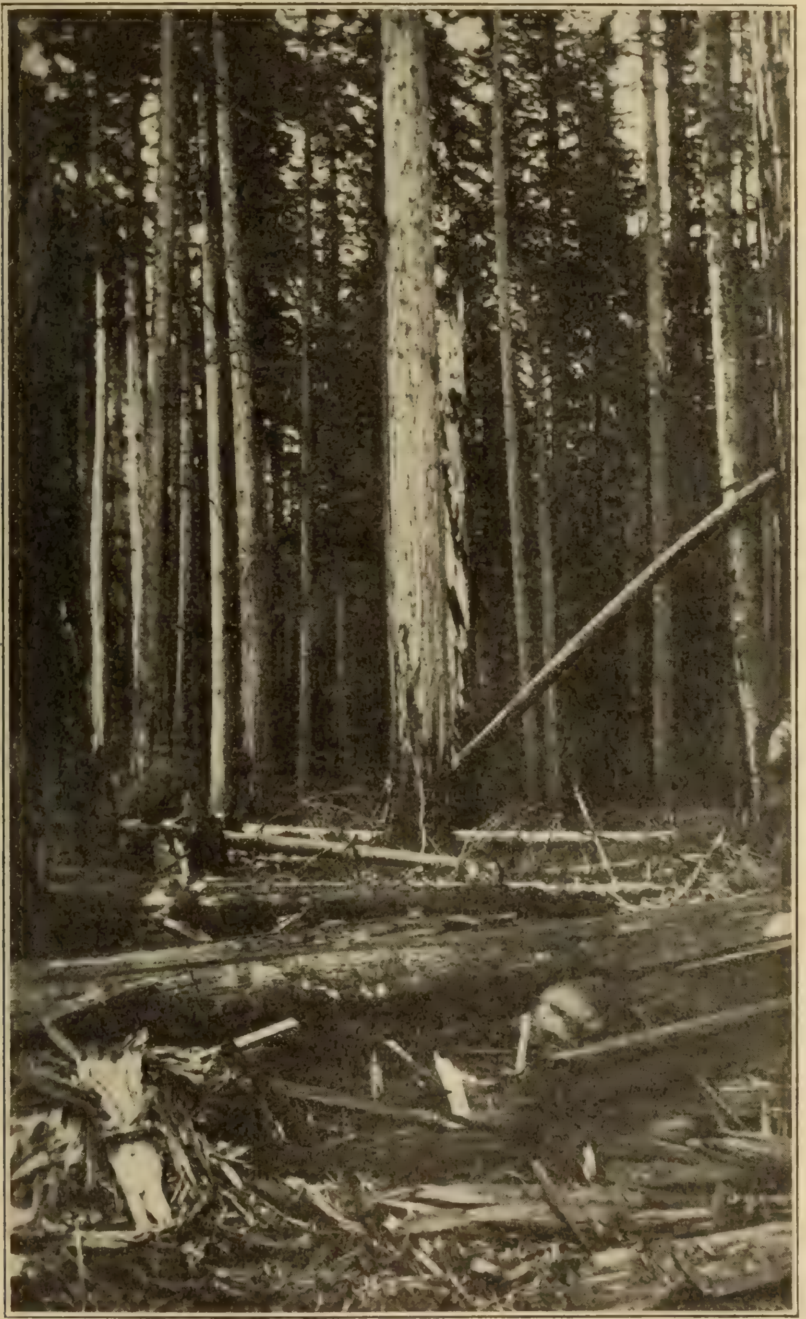
Besides the data embraced in this report, a great mass of other data has been gathered, by the U. S. Departments of Agriculture and Interior, under the coöperative agreements with the Water Commission and the Conservation Commission. These data are of great value, but their bulk is so great as to preclude their publication in this report, therefore they have been published by the United States Government and made available for immediate use. Some of these reports have already been published and are distributed, on application, free to all interested persons, by the U. S. Geological Survey, or by this office. The following is the list of those already published and ready for distribution:

295. Gazetteer of Surface Waters of California. Part 1. Sacramento River Basin.
296. Gazetteer of Surface Waters of California. Part 2. San Joaquin River Basin.
297. Gazetteer of Surface Waters of California. Part 3. Great Basin and Pacific Coast Streams.
298. Water Resources of California. Part 1. Stream Measurements in Sacramento River Basin.
299. Water Resources of California. Part 2. Stream Measurements in San Joaquin River Basin.
300. Water Resources of California. Part 3. Stream Measurements in Great Basin and Pacific Coast River Basins.

FORESTRY.

INSPECTION OF TIMBER AREAS.

During the summer of 1912 the Commission made an inspection of the coast timber areas of the northern part of the State, discussing with the owners of timber and the general public the needs for the protection of timber from fire.



Redwood timber in northern California, showing how the logged section has been fired.

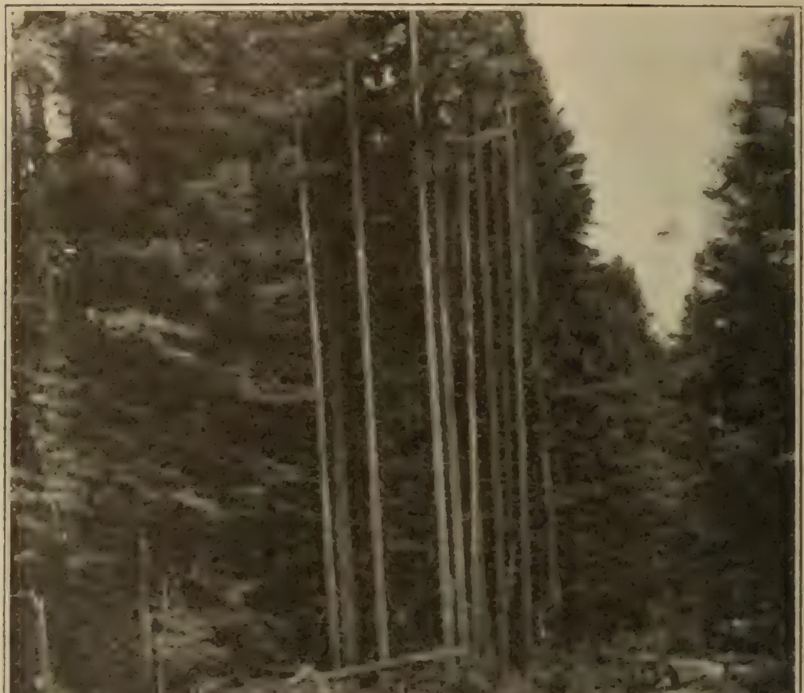


FIG 67.—Young second growth redwood of considerable size, being from 24 to 30 inches in diameter.

PUBLIC MEETINGS HELD.

The Commission held public meetings in San Francisco and Los Angeles, to which all persons interested in the subject under investigation were invited, in order to obtain opinions from men conversant with the practical and legal aspects of certain tentative measures for the conservation of the waters of the State.

Other public meetings were held by the Commission for the discussion of proposed changes in the laws relative to the protection of the timber and the streams of the State. Those interested in the industries proposed to be affected by any new measures and the public, were invited to discuss and criticize the proposed changes in the laws.

The object of these trips and meetings was to familiarize the Commission, to some extent at least, with the physical conditions pertaining to water power, developed and undeveloped; to observe the cut-over lands and timbered areas in the more heavily timbered portions of the State, and the adaptation of the soil to, and other conditions relative to reforestation.

Many of the persons who appeared before the Commission during these trips and meetings were financially interested in water power, many were lumbermen, and others were citizens generally interested in the proceedings of the Commission. The Commission's purpose in holding these hearings was to acquaint itself with the sentiment existing among all classes of citizens in the sections of the State that would be most affected by changes in the laws relating to water power, irrigation, and forestry. Full stenographic reports of these meetings are contained in the files of the Commission. The Commission believes that the work it has accomplished along these lines is of considerable value.

CESSION OF LANDS TO REDWOOD PARK.

Believing that the area of state-owned forests should be enlarged, and that certain lands owned by the United States should be conveyed to the State for such purposes, the Commission endorsed the act of Congress by which the Federal Government granted to this State additional tracts of land in the four townships adjoining the present area of the California Redwood Park.

NECESSITY FOR FIRE PROTECTION.

The prevention and suppression of forest fires, it is conceded by everyone, is the greatest problem that conservationists have to deal with. Upon its solution depends the success of all the other measures for forest protection. A forest fire may not only destroy virgin timber, but menaces the water supply, and fish and game, and makes difficult the successful application of reforestation methods to the areas burned over. The framing of a measure containing a system for the prevention of fires is the aim of all conservation bodies of the country. Nothing

Fire running through pine timber. This light method of burning is employed by some large timber holders.

can be accomplished in this direction without adequate appropriations to put into execution such a system. Fires in forests have always followed timber cutting, with the result that many thousand acres of land are now barren wastes covered with blackened stumps, worthless shrubs and chaparral. These worthless growths not only serve as a dangerous fire menace, but, in addition, choke out and kill the natural second growth that would develop into merchantable timber under more favorable conditions.

The Diamond Match Company's mill at Sterling City, Butte County.

STATE FORESTER'S REPORT ON FOREST FIRES.

The State Forester in his biennial report for 1910, says:

"There are about 30,000 square miles of forested land within the State. Timber on this area is estimated at three hundred billion feet, board measure, with a stumpage value of approximately $700,000,000 and a manufactured value of at least six times as much. Each year the lumber industry puts more than $20,000,000 into circulation. Here surely is an enormous asset which under improper treatment will rapidly disappear, but which properly handled will last for all time."

COÖPERATION WITH LANDOWNERS.

Further on in this report the Forester states:

"Since many lumbermen are indifferent to fire, or consider slash burning and systematic protection impracticable, it is clearly a duty of the State forest officers to coöperate with the private landowners, and inaugurate plans of fire protection on lumber tracts in representative regions. It is also their duty to enforce the state fire laws, and secure a change of sentiment by an educational campaign. For lumbermen have often been regarded by unthinking persons as enemies of the public. Their property is as a rule so situated that it really does make a difference to the public whether it is handled well or ill. And because conditions of markets and transportation have hitherto been such as to almost compel wasteful methods the lumberman has received the name of vandal, and has often found himself unable to obtain a fair hearing. The noisiest conservationists are apt to be those who know the least about the subject, and the profession and practice of forestry has always suffered most not from its opponents but from its hysterical friends. Such are always likely to advocate mischievous legislation to regulate the private handling of timber land. Reasonable legislation most progressive lumbermen have no objection to, but laws might easily be passed that would put them entirely out of business, and with sentiment so strongly against them as at present dare not openly protest. In order to enable lumbermen and timber owners to protect themselves from misrepresentation it was proposed to them to form an association under the auspices of this office. With more than half the timber of the State in private ownership, the attitude of the lumbermen toward forestry is without question of great importance. This office has endeavored to introduce forestry principles in the lumber woods by degrees with the view of working around later toward more and more conservative methods, but always to show the lumberman that the changes suggested are practical and in his own as well as the public interest. Our object is not to force the lumberman by legislation or otherwise to adopt better methods against his will, but to suggest only those changes as are reasonable and show him that those are a good investment. In consequence a number of large concerns are now making a practice of burning over in the fall or spring the area cut over the previous summer in order to reduce fire danger and leave the ground in the most favorable condition for reproduction. Thereafter the area is to be protected.

This is only a beginning, but it represents an enormous advance over the methods of previous years, and in itself if generally adopted will prevent cut-over land from falling into the ruinous state which formerly was almost certain to ensue. It has furthermore been accomplished without sacrificing friendly relations between the lumbermen and this office. If lumbermen had been forced to adopt such methods under penalty for refusal little good would have resulted. No doubt the future will show the need of regulating lumbering to some extent by law. There will always remain some shortsighted lumbermen who will be content to log under the old methods even after conditions have changed to such an extent that they are no longer either necessary or profitable. These will wish to skin their land and neglect it after it is once cut over, and in the interest both of the public and of the more progressive lumberman who wishes to adopt conservative methods public opinion will demand that they be legislated against; proper forestry laws, however, are by no means easy to frame; they must be drawn by experts if they are to work well. The lumberman must be consulted, not necessarily because he has an interest in such laws, but because his knowledge of the subject is the most exact obtainable. Yet with public sentiment the way it is the lumberman is practically barred from participation, especially if his opinion on proposed legislation runs counter to that of the ordinary citizen.

A campaign of education is therefore necessary to show the public (what they least expect) that the foremost practical conservationist is the progressive lumberman, and to organize and systematize this campaign was one of the objects of the proposed association. Other objects were to secure more effective protection from forest fires by coöperation to that end; to get the lumber industry as a whole in closer touch with this office; and to provide an opportunity for lumbermen to discuss with each other affairs relating to their business.

A preliminary meeting was held in October, 1909, in San Francisco, to discuss the question of organizing such an association. All parts of the State sent representatives. The need of an association was shown at once by the great variety of opinions expressed. It was decided, however, that an association should be formed with the title California Forest Protective Association, and a committee was appointed to draw up articles. There was so much delay, however, on the details of organization that the forest fire season came on with no general organization accomplished. One practical result of the meeting was the formation of a small coöperative forest fire association by four redwood companies whose holdings adjoin each other. A further attempt to form a general association will be made this winter."

STATE FORESTRY APPROPRIATIONS.

For the protection to the public of this valuable forest asset, the Legislature, in 1911, appropriated, for the fiscal years from July, 1911, to July, 1913, the following sums:

Salary of State Forester	$6,000 00
Salary of Assistant State Forester	3,200 00
Salary of Deputy State Forester	3,600 00
Printing for State Board of Forestry	2,500 00
Expenses of State Board of Forestry	15,000 00
	$30,300 00

No part of this sum has been, or can well be expended for fire protection. It is necessarily used largely for traveling expenses and the employment of additional assistance. Had the Legislature, at the last session, appropriated money for the protection of the water sheds of navigable streams, the Federal Government, under the provisions of the ''Weeks Law'' would have been authorized to place at the disposal of the State an amount equal to the amount so appropriated by the State, not in excess of $10,000.

NUMBER OF AND DAMAGE BY FOREST FIRES.

The State Forester, Mr. G. M. Homans, informs this Commission that, during the year 1909, there were 357,269 acres of forest land burned over in this State, ''destroying merchantable timber worth fully $100,000, and buildings to the amount of half a million dollars.'' In 1910, according to the State Forester, ''519,463 acres were burned over, and the direct damage amounted to $683,989.20.'' In 1911, ''282,284 acres were burned over. The damage was estimated to be $128,451.50. In 1912, up to November 1, 92,920 acres were burned over.''

The State Forester further shows in his report for June, 1912, that there were 738 forest fires in California during the year 1910. This resulted in a loss of over half a million dollars. These fires were caused in various ways, but most of them could have been prevented. The report continues: ''263 were of unknown origin, campers were responsible for 122, lightning 119, miscellaneous 76, incendiary 70, brush burning 54, railroads 17, and sawmills 17. In such a state as ours, forest protection alone can maintain the stream flow for irrigation, can prevent destructive forest fires and can provide for all time a timber supply sufficient to perpetuate our wood using industries. The situation is serious and there is only one remedy. That remedy is the introduction of practical forestry on a large scale, and, of course, that is impracticable unless an intelligent economical plan for fire control is operative. When the general public, timber owners, and the State are thoroughly alive to the necessity for fire protection then and only then will the chief stumbling block be removed.''

The destruction of timber by fire results in less work for the laborer, less taxes for the county, less shipping for rail and water transportation, and less income to the people of the State generally. It means that certain areas of land are rendered valueless for any purposes. It means danger to the streams, springs and other sources of water supply for all purposes.

OWNERSHIP OF FORESTS.

Of the standing timber in this State a very large percentage is now privately-owned. The total acreage of the privately-owned timber and the counties in which such timber is situated are as follows:

Name of county.	Acreage.
Mendocino	475,318
Trinity	233,840
Marin	11,597
Lake	10,320
Butte	89,737
Riverside	4,784
Yuba	19,400
Glenn	16,796
Tulare	33,358
Santa Cruz	19,956
San Luis Obispo	2,040
San Bernardino	10,940
Santa Barbara	160
San Diego	23,460
Kern	8,600
Ventura	803
Fresno	19,983
Tuolumne	131,378
Mariposa	35,073
Madera	23,176
Placer	156,949
Monterey	81,518
Nevada	60,101
Siskiyou	693,180
Tehama	126,358
Modoc	265,317
Lassen	244,434
Del Norte	109,600
Alpine	3,270
Mono	15,320
Amador	17,903
Sierra	134,176
Sonoma	162,474
San Benito	2,960
Plumas	224,717
Shasta	429,512
Calaveras	68,663
El Dorado	96,820
Humboldt	486,950
Total for State	4,555,941

The timber areas owned in these counties and the manner in which they are held is more definitely shown in the following tabulations:

Groups.	Approximate acreage of individual holders.	Number of holders.	Amount of timber in acres.	Per cent of total.
1	Over 500,000	2	1,536,238	33.70
2	Over 100,000	1	156,696	3.44
3	Over 50,000	6	399,809	8.78
4	Over 20,000	21	671,155	14.77
5	Over 15,000	18	304,757	6.68
6	Over 10,000	19	236,052	5.18
7	Over 5,000	41	279,654	6.12
8	Under 5,000	1,165	971,580	21.33
Totals		1,273	4,555,941	100.00

Further data, embracing the ownership of forest lands in this State and containing the names of the owners of and the amount of such land owned by each such owner, together with the counties in which such holdings are located, are attached hereto and marked Exhibit "A."

MAP OF TIMBER HOLDINGS.

A timber map has also been prepared by this Commission, showing the geographical location and acreage of the holdings set forth in the above referred to tabulation. This map is attached hereto and marked Exhibit "B." The full information relative to the holdings of the Pennsylvania Lumber Company, Michigan Trust Company, and Vance Lumber Company (see Group 4 of table), was not available at the time the timber map was prepared. For that reason their holdings are shown on the map as being among those owning less than 20,000 acres of timber land.

TAXATION OF FORESTS.

This question has been a vexed one for a long time. The owners of forests claim that the annual taxation of standing timber is an ever increasing incentive to the cutting of the timber and the consequent early destruction of the forests. The timber men point to the fact that timber is as much of a crop as grain; but that, unlike grain, which ripens annually and is cut, timber ripens only at intervals of many years and should not be cut before it is ripe, if an economic waste is to be prevented. The timber men also call attention to the fact that growing crops of grain and fruit trees and vines, before they reach the productive age, are, by constitutional provision, exempted from taxation, and that grain, fruit and the products of the vine are taxed only after they are harvested or picked. The timber men, therefore, claim that it is unfair to tax growing crops of trees; and that this natural resource ought not to be taxed until, having been harvested, it takes the form of cut lumber or timber. They assert with not a little plausibility, that such a tax system would result in a longer conservation of the forests.

On the other hand, though, it is claimed that, because of its annual increase in volume, and because of its constantly increasing annual value, on account of the constantly decreasing supply, a forest should be annually taxed in order that the public may annually receive its proper share of its annual taxation-product. It is also pointed out that, in many counties of this State, the area of privately-owned forests is so great that, were the standing timber not annually taxed, it would be impossible for such counties properly to carry on their county governments or to keep their public schools open.

The owners of forests, however, meet this argument by saying that there would be nothing unfair in annually assessing, at its value as bare land, and annually taxing as bare land the timbered areas of the State, just as agricultural and other lands are assessed and taxed, leaving the timber to be assessed and taxed, as grain crops are, when it is cut.

The Conservation Commission is free to confess that this subject-matter is one to which it has, as yet, been unable to give sufficient attention to enable it to formulate any recommendation to the Legislature.

STATE FORESTER'S DATA ON FOREST TAXATION.

Preliminary data have been gathered by State Forester Homans in coöperation with the Conservation Commission, relative to the taxation of forests, is attached hereto and marked Exhibit "F."

Accompanied by a self-explanatory letter of submittal, it consists of a table setting forth, by counties, the highest and lowest assessments of timber and cut-over lands; the tax rate by counties, and the "estimate of total amount of county tax derived from timber land." It also contains a discussion, by counties, of the assessed valuation and taxation of the various kinds of lands, the tax rates, the amount of timber in each county, etc.

PROPOSED FIRE BILL.

The Commission's proposed forest fire bill, if enacted into law, will, the Commission believes, greatly aid in the prevention and suppression of forest fires. The State should have a well organized fire patrol under the guidance of a practical firewarden, which is the most effective known manner of preventing and suppressing fires. Among other methods advocated is that of volunteer fire associations, but from the information at hand we are of the opinion that this plan works well only in theory. In actual practice it is found that the members hesitate to compel one another to clean up a dangerous fire-menace in the forest, or to take any definite action to prevent fires. The subordinates having the management of these voluntary associations likewise have some hesitancy about ordering the men from whom they draw their salaries to attend to nuisances and other matters that may have been neglected. This is especially true as to the member who subscribes most liberally.

A fire in brush and cut-over lands frequently does as much damage as a fire in standing timber. The fires in the brush in the southern part of the State have threatened the water sheds and diminished the water supply upon which the fruit grower is dependent for the irrigation of his orange groves and other crops in that section. With the expenditure of a comparatively small sum of money, during the dangerous seasons, in the maintenance of fire patrols, this danger and damage would be greatly lessened, if not eliminated.

Light burning methods used by some of the large timber holders.

States suffering from the results of large and disastrous fires, costing millions of dollars and, in some cases, many lives, are realizing that the prevention of fires is more effective and economical than fighting fires after they are started.

The great difficulty in devising a plan for an adequate and permanent system of forest fire prevention and suppression is in securing an appropriation sufficiently elastic to bear the burden of unusual and unexpected heavy demands upon it for the actual fighting of fires. It is a comparatively simple matter to make an estimate of what it will cost to employ the necessary number of rangers to patrol a forest, but if a number of large and disastrous fires should break out and the State should have to employ extra men to fight them, thereby incurring a large and unforeseen expense, it would tend to cripple the regular patrol force and render the whole system ineffectual. The timber owners, who receive the benefits, should be called upon for at least a part of the extra expense incurred in forest fire protection.

It would be impossible for the authorities to ascertain in every instance who is directly responsible for a fire. Therefore, the law makes it the duty of each land owner to extinguish a fire originating on his own land. (See Sec. 2, Chap. 699, Act May 1, 1911; and Sec. 18, Chap. 264, Laws 1905.)

It is a well settled and fundamental principle of the law that if one man performs an act that another is legally bound to perform, he is entitled to compensation for his services, with the proviso that the person bound by law to perform such act, must first receive proper notice. This is a wise and necessary provision in cases where such notice can be given without involving danger and risk in delay. In the case of a fire, however, which is dangerous to life and property, it is obvious that such notice would be ineffectual; for by the time the responsible person received notice the damage would be beyond repair and the fire beyond control.

Pine timber destroyed by fire.

CONSTITUTIONALITY OF BILL.

This Commission, after examining the laws of other states and the present California fire laws, believes that the provisions of the proposed measure are not only legal but are the most equitable and just for all persons affected thereby. Many objections have been made to the proposed bills. Some claim that such provisions will cause undue hardships; while others advance the opinion that certain provisions of the proposed bill are unconstitutional, being a violation of article IV, Section 25, subsections 24 and 33, which are as follows:

> "The legislature shall not pass local or special laws in any of the following enumerated cases, that is to say: Subsec. 24. Authorizing the creation, extension, or impairing of liens.
>
> Subsec. 33. In all other cases where a general law can be made applicable."

In this connection the Supreme Court of this State, in *Smith* vs. *McDermott* (93 Cal. 421; 29 Pac. 34), says: "A special law is one relating to a selected class, as well as a particular object."

Chief Justice Morrison in *Ex parte Burke,* 59 Cal. 6, 43 Am. Rep. 231, states what is a general and what a special law.

The court decided in *Abell* vs. *Clark* (84 Cal. 226, 24 Pac. 383, and other cited cases) that "An act applying uniformly upon the whole of any single class of individuals or objects, when the classification is founded upon some natural, intrinsic or constitutional distinction, is a general law."

"General laws are those which operate alike upon all persons to whom they apply." (89 Cal. 522.)

The proposed measure was framed to conform to the provisions of article XIX, section 1 of the Constitution, relative to the "police power" of the State.

In this connection the following citations are applicable:

> "Police regulations are not unconstitutional because they may incidentally operate to deprive individuals of their property without compensation, nor because they may create monopoly." (*In re Zhizhuzza,* 147 Cal. 328, 81 Pac. 955.)
>
> "An act giving the Horticultural Commission power to abate a nuisance caused by insect pests in orchards," etc., is authorized by this section. (Art. XIX, Sec. 1.) (*Los Angeles County* vs. *Spencer,* 126 Cal. 670, 77 Am. St. Rep. 217, 59 Pac. 202; *Riverside County* vs. *Butcher,* 133 Cal. 324, 65 Pac. 745.)

In this connection sections 3479 and 3480 of the Civil Code of California are pertinent. As to the power of the State to regulate the abatement of public nuisance, which question is largely involved in the proposed measure, we call attention to the following decisions: *County of Los Angeles* vs. *W. D. Spencer,* 126 Cal. 670, involving the right of the Horticultural Commission to destroy certain diseased trees and to make the owner pay for such destruction.

> "The police power deriving its existence from the rule that the safety of the people is the supreme law, justifies legislation upon matters pertaining to the public welfare, the public health and the public morals." (6 Cal. App. 237; *Ex parte Drexel,* 147 Cal. 766, 82 Pac. 429.)
>
> "It is settled law that all property is held subject to police power and that the provision of the constitution declaring that property shall not be taken without due process of law has no application in such cases." *Odd Fellows Cemetery Co.* vs. *San Francisco,* 140 Cal. 230.)

For acts of the legislature conferring powers similar to those contained in the proposed bill, the following citations will suffice:

Power to abate nuisance and make charge therefor a lien on property. (Section 3028, Pol. Code.)

The rat and squirrel nuisance law confers a similar power. (Sec. 2506*a*, General Laws.)

State Board of Horticultural Examiners authorized to destroy infected trees and charge cost to the land, etc. (Sec. 2322*a*, General Laws.)

OPINION OF SUPREME COURT OF MAINE.

As to whether the Legislature has the right to enact such a law, as is now proposed, in its exercise of the police power conferred upon it by the constitution, we believe that the question cannot be better answered than in the language contained in the opinion of the Supreme Court of the State of Maine. In March, 1908, the Legislature of that state submitted to the Court the question whether or not the Legislature could pass laws restricting, prohibiting, or regulating the cutting or destruction of trees on wild or uncultivated land by the owner thereof and whether such restricting, prohibition or regulating would be regarded as such a taking of private property for public use as would demand compensation for the owner. The opinion of the court is so clear and the principles laid down therein so far reaching in their effect, that it is necessary to print a copy thereof in full, viz.:

"The undersigned justices, in obedience to the requirements of the constitution, severally give the following as their advisory opinion upon the questions of law submitted to the justices of the supreme judicial court by the senate order of March 27, 1907:

"We find that the legislature has by the constitution 'full power to make and establish all reasonable laws and regulations for the defense and benefit of the people of this state, not repugnant to this constitution nor that of the United States': Constitution of Maine, Article IV, Part III, Section 1. It is for the legislature to determine from time to time the occasion and what laws and regulations are necessary or expedient for the defense and benefit of the people; and however inconvenienced, restricted or even damaged particular persons and corporations may be, such general laws and regulations are to be held valid unless there can be pointed out some provision in the state or United States constitution which clearly prohibits them. Those we understand to be universally accepted principles of constitutional law.

"As to the proposed laws and regulations named in the senate order, the only provision of the United States constitution having any possible application to such legislation by a state would seem to be that in XIV amendment. As to that provision, we think it sufficient to quote the language of the United States supreme court in *Barbier* versus *Connolly*, 113 United States 27, where, speaking of the fourteenth amendment, the court said: 'But neither the amendment, broad and comprehensive as it is, nor any other amendment was designed to interfere with the power of a state, sometimes termed its "police power," to prescribe regulations to promote the health, peace, morals, education and good order of its people, and to legislate so as to increase the industries of the state, develop its resources and add to its wealth and prosperity.' It may be added that the proposed laws and regulations would not discriminate between persons or corporations but only between things and situations, with a classification not merely arbitrary but based on real differences in the nature, situation and condition of things.

"We think the only provision in the state constitution that could be reasonably invoked against the proposed laws and regulations are the guaranteed right of 'acquiring, possessing and defending property' and the provision that 'private property shall not be taken for public uses without just compensation.' (Dec. of Rights, Sections 1 and 21.) If, however, the proposed legislation would not conflict with the latter provision, it evidently would not with the former; hence, only the latter one need be considered.

"The question of what constitutes a 'taking' of private property in the constitutional sense of the term has been much considered and variously decided. In the earlier cases and in the older states the provision has been construed strictly. In some states, in later cases, it has been construed more widely to include legislation formerly not considered within the provision. Still more recently, however, the tendency seems to go back to the principles enunciated in the earlier cases. In Massachusetts, one of the earliest states to adopt the constitutional provision, and in Maine, adopting the same provision in succession, the courts have uniformly considered that it was to be construed strictly as against the police power of the legislature.

Commonwealth versus *Tewkesbury*, 11 Met. 55, decided in 1846, was a case where the legislature prohibited the owners from removing 'any stones, gravel or sand' from their beaches in Chelsea as necessary for protection of Boston harbor. The court held that the statute did not operate to 'take' property within the meaning of the constitution, but was 'a just and legitimate exercise of the power of legislature to regulate and restrain such particular use of property as would be inconsistent with or injurious to the rights of the public.' *Commonwealth* versus *Alger*, 7 Cush. 53, decided in 1851, was a case where the defendant was prohibited by statute from erecting and maintaining a wharf on his own land (flats) beyond certain fixed lines. The court held that the defendant's title to the land (flats) was a fee simple, and that but for statute he would have had full right to erect and maintain wharfs upon any part where they would not obstruct navigation. It was not claimed that the proposed wharf would obstruct navigation but rather admitted that it would not. The court further held, however, that the statute was within the legislative power and not forbidden by any clause in the constitution. The question was considered at length in an opinion by Chief Justice Shaw, and the principle stated as follows:

" 'We think it a settled principle, growing out of the nature of well ordered civil society, that every holder of property, however absolute and unqualified may be his title, holds it under the implied liability that his use of it shall be so regulated that it shall not be injurious to the equal enjoyment of others having an equal right to the enjoyment of their property, nor injurious to the rights of the community. All property in this commonwealth, as well that in the interior as that bordering on tide waters, is derived directly or indirectly from the government and held subject to those general regulations which are necessary for the common good and general welfare. Rights of property, like all other social and conventional rights, are subject to such reasonable limitations in their enjoyment as shall prevent them from being injurious, and to such reasonable restraint and regulations established by law as the legislature, under the governing and controlling power vested in them by the constitution, may think necessary and expedient. This is very different from right of eminent domain,' " etc.

"In the case *Wadleigh* versus *Gilman*, 12 Maine, 403, decided in 1835, only fifteen years after the adoption of our constitution, there was upon the plaintiff's land a wooden building. A city ordinance was passed by legislative authority prohibiting the erection of wooden buildings within certain limits, which included the plaintiff's building. After the passage of the ordinance the plaintiff moved his building to another place within the same inhabited limits. The defendant, as city marshal, acting under the ordinance, entered upon the plaintiff's land, took the building down. The court held the ordinance valid and the defendant protected, and declared as follows (p. 405): 'Police regulations may forbid such a use and such modifications of private property as would prove injurious to the citizens generally. This is one of the benefits which men derive from associating in communities. It may sometimes occasion inconvenience to an individual, but he has compensation in participating in the general advantage. Laws of this character are unquestionably within the scope of the legislative power without impairing any constitutional provision. It does not appropriate private property to public uses, but merely regulates its enjoyment.' "

"In *Cushman* versus *Smith*, 34 Maine, 247, decided fifteen years later, in an elaborate opinion by Chief Justice Shepley, the court said of the constitutional provision in question (page 258) 'The design appears to have been simply to declare that private property shall not be changed to public property, nor transferred from the owners to others for public use without just compensation.' In *Jordan* versus *Woodward*, 40 Maine, 317, it was said by the court at page 324:

'Strictly speaking, private property can only be said to have been taken for public uses when it has been so appropriated that the public have certain and well defined rights to that use secured, as the right to use the public highway, the turnpike, the ferry, the railroad and the like.' The same doctrine was recognized in *Preston* versus *Drew*, 33 Maine, 558; *State* versus *Gurney*, 37 Maine, 156; *Boston & Maine Railroad Company* versus *County Commissioners*, 79 Maine, 386; and as late as 1905, in *State* versus *Robb*, 100 Maine, 180.

"There are two reasons of great weight for applying this strict construction of the constitutional provision to property in land: First, such property is not the result of productive labor, but is derived solely from the state itself, the original owner; second, the amount of land being incapable of increase, if the owners of large tracts can waste them at will without state restriction, the state and its people may be helplessly impoverished and one great purpose of government defeated.

"Regarding the question submitted, in the light of the doctrine above stated (being that of Maine and Massachusetts at least) we do not think the proposed legislation would operate to 'take' private property within the inhibition of the constitution. While it might restrict the owner of wild and uncultivated lands in his use of them, might delay his taking some of the product, might delay his anticipated profits, and even thereby might cause him some loss of profit, it would nevertheless leave him his lands, their product and increase, untouched, and without diminution of title, estate or quantity. He would still have large measure of control and large opportunity to realize values. He might suffer delay but not deprivation. While the use might be restricted it would not be appropriated or 'taken.'"

"The foregoing considerations lead us to the opinion at present that the proposed legislation for the purposes and with the limitations named in the senate order, would be within the legislative power and would not operate as a taking of private property for which compensation must be made."

Respectfully submitted.

LUCILIUS A. EMERY.

LESLIE C. CORNISH.

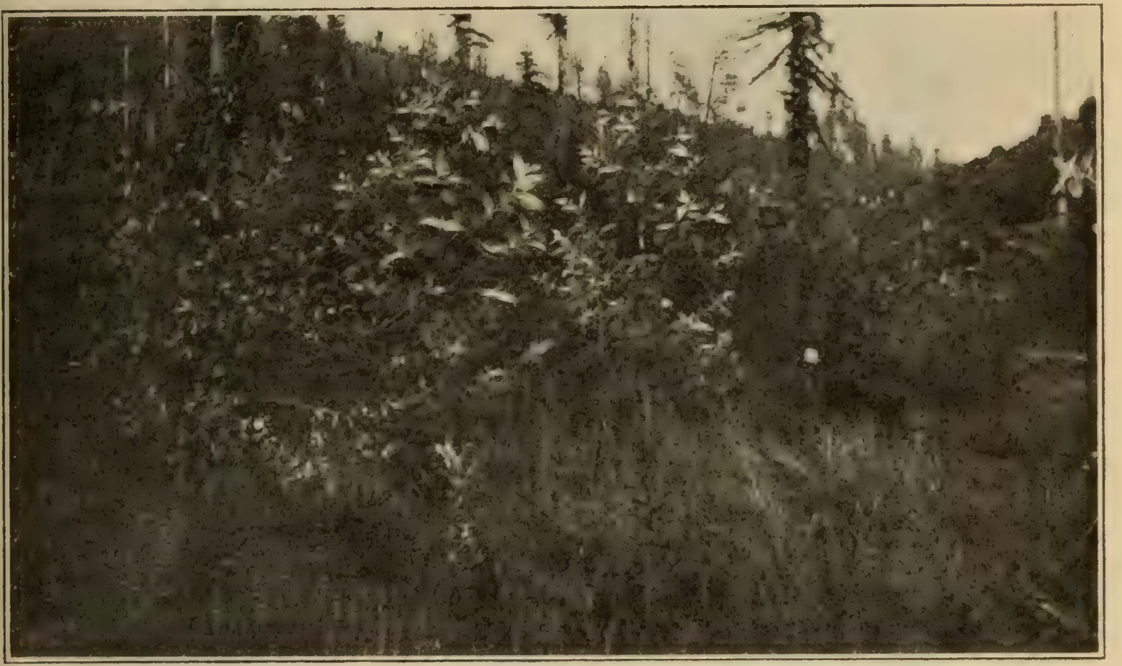
March 10, 1908.

This idea is also very well expressed in the case of *Hudson Water Co.* vs. *McCarter,* contained in 209 U. S. 349:

"The State as quasi-sovereign and representative of the interest of the public, has a standing in court to protect the atmosphere, the water, and the forests, within its territory, irrespective of the assent or dissent of the private owners immediately concerned." (*Kansas* vs. *Colorado*, 185 U. S. 125); (*Georgia* vs. *Tennessee Copper Co.*, 206 U. S. 230.)

REFORESTATION.

The subject of reforestation is one of the most important that confronts this country. Our timber supply will, at present rate of forest destruction, be exhausted in less than fifty years. Efforts to encourage tree planting and forestry have been made at different intervals and by different methods for the last twenty-five years. These efforts have not been attended with success, for the reason that the work has not been put in the control of the proper agency. Inducements have been offered to individuals to practice tree planting; but when the inducement is withdrawn, tree planting ceases.



Young eucalyptus trees that have been planted on cutover redwood land, as a protection to young second growth redwood.

Reforestation is the duty of the Federal and State governments, especially during its experimental period, because it is particularly for the benefit of future as well as present generations, and consequently does not, under present conditions, encourage the investment of private capital. Enterprises offering returns on the investment during the life time of the investor are naturally more attractive than those which are experimental or for realization in the far future. The Federal and State governments must, therefore, by their example, encourage the owner of large areas of cut-over land to reforest those lands.

Instead of being a source of extra taxation, forestry, when properly handled, will become the medium of greater income to the State. By proper reforestation, the forests will become self-sustaining and a source of profit to the State, as they have been in the past to the private owner. For every dollar the timber owner makes out of timber, the community and state generally make two. This is because of the creation of business and the circulation of money through the employment of labor in the woods, mills and other places necessary to conduct a lumber business. Maine, New York, Wisconsin, Minnesota and a great many Eastern States have purchased lands for reforestation purposes. They have paid as high as ten dollars an acre for lands, and have purchased many thousand acres.

Good, natural redwood second growth on the Ten-Mile River, Mendocino County.

The California Redwood Park, comprising 3,800 acres is the only state-owned forest land in California. No provision has been made for obtaining other land for State forests. In that respect we have failed to keep pace with certain Eastern States, and also with a number of the Western States.

We are not yet awake to the urgent need of growing more timber. Many are of the opinion that the need does not exist; but this class of people consists chiefly of those who are not acquainted with conservation problems. A few years ago, Wisconsin, Minnesota, Michigan and other states, thinking there was no danger of their timber supply failing them, made no provision for its preservation or for future forests. The legislatures of these states, and the Southern States as well, are now making laws for the preservation and protection of all their natural resources.

When New York had the forestry problems brought to its attention, lands suitable for reforestation purposes could have been purchased for one dollar and a half per acre. After realizing the need for protecting the forests from destruction and the waterways and streams from pollution and waste and even destruction, the Commission appointed to handle the matter was able to get some land for $3.45 per acre, but had to pay far more than that for other lands.

At present lands for reforestation purposes are at their minimum value in California. It would be to the best interests of the State to purchase cut-over lands at once, before values increase and the timber supply is still further diminished.

RECOMMENDATIONS OF NEW YORK GOVERNORS.

It was recommended to the legislature of New York by Governor Flower, in his message of 1893 in connection with a reorganization of the Forest Commission, (1) ''That forest tracts owned by individuals or private associations and used mainly for the purpose of reforestation should be secured as a part of the forest reserve and guarded against denudation by a contract with the State providing for exemption from taxation in consideration of forest protection and restrictions on the removal of timber, and (2) that revenue should be secured to the State by granting permission to fell trees above a certain diameter on State lands and to remove the timber.'' Legislation embodying these recommendations was enacted in 1893 and the results were stated by Governor Flower in his next annual message, from which the following extracts are quoted:

> "The new Forest Commission is now able to report that 225,000 acres of Adirondack land has been offered to the State upon the terms of the proposed contract and the standing spruce timber exceeding twelve inches in diameter has been sold on 17,468 acres of State lands from which it is expected that the first year's cutting will yield to the State a revenue of $52,400. * * * *
>
> "It thus appears that the state forest preserve has been increased by probably a million dollars' worth of lands without any direct appropriation of public money and that the first year of intelligent administration under the new law has insured to the State an annual revenue largely in excess of the entire cost of maintaining the Forestry Bureau. If from so small a portion of the Forest Preserve so considerable a revenue is received without injury to the forests we can reasonably look forward to the time when the Forest Preserve will not only be the great conservator of our water courses and the restorer of health, but will contribute a large part of the money required for the support of the state government."

Governor Morton of New York in his annual message of 1896 pointed out that "unless these lands are acquired within a reasonable time they can only be obtained at higher cost many years hence."

Governor Black of New York in his annual message of 1897, speaking of the loss to the state of timber through fires, floods and cutting, said: "Some time this deplorable condition must be rectified. Every year the loss to the State becomes greater, in all cases difficult and in some cases impossible of recovery. The land is steadily and rapidly increasing in value." * * * "A subject of such magnitude should not be postponed nor conducted with the halting method which is too apt to distinguish public enterprises in which large appropriations afford convenient resting places in which office holders may grow old." * * * "Every consideration of health, pleasure, economy and safety urge the speedy consideration of this subject."

NEW YORK APPROPRIATES MILLIONS.

Thereupon the legislature appropriated the sum of $1,000,000 for the acquisition of forest lands and created "The Forest Preserve Board" with authority to purchase tracts within the Adirondack Park. With this appropriation the Board acquired over 250,000 acres at an average cost of $3.74 per acre. In 1898 another appropriation was made of $500,000 and in the years 1899 and 1900, under the administration of Governor Roosevelt, $600,000 was appropriated for these purposes. In 1904 there was an appropriation of $250,000. In 1906, $400,000 more was appropriated and this was followed by an appropriation in 1907 of $500,000.

While the greater portion of the money appropriated, as above set forth, was for the purpose of acquiring title to definite tracts of land to be included in the "Adirondack Park" and in the "Catskill Park," the general purpose of acquiring cut-over lands for reforestation purposes was carried out along lines similar to those urged in this report. In that respect the quotations from the various reports and messages to the New York legislature are pertinent. What has been found to be advisable in New York and other Eastern States will be found advisable here. California has an advantage over the Eastern States, in that we can take warning from their experience and adopt precautionary measures before it is too late.

FORESTRY CONDITIONS IN OTHER STATES.

The table appended hereto sets forth the forestry conditions in certain other states—seventeen in number. The states selected, it will be noticed, include those Pacific Slope States in which there are any considerable bodies of timber, together with exemplar states in the extreme East, where, it is commonly supposed, the forests have practically disappeared, as well as examples from the Middle West and the South.

The table gives, for each state, the annual appropriations for forestry in 1911, and the amounts actually expended for fire protection; designates by whom the patrol system is maintained; sets forth the method by which money for fire protection purposes is obtained from the owners of forest lands; shows who pays the cost of fighting fires; gives the approximate acreage of forest lands in private ownership, the acreage of state timber lands, and the acreage of forest lands in National Forests.

For this table the Commission is indebted to Mr. T. E. Loynahan.

APPROPRIATIONS AND EXPENDITURES FOR FORESTRY PURPOSES.

State.	Annual appropriation.	Expended for fire protection.	Patrol systems maintained by—	Method of obtaining money from owners.	Cost of fighting fires paid by—	Acreage of private lands.	Acreage of state timber lands.	Acreage of national reserves.
California	$7,150 00		State and individuals and federal government and associations.	Individuals or association assessments.	Owners	8,500,000	2,000	11,000,000 annually forested; total acreage, 27,667,355.
Oregon	$30,000 00	$13,788 20 Week's law, $3,305.	State and associations and federal government and individuals.	Acreage assessments.	Owners and state.	15,000,000	None	16,000,000
Washington	$38,000 00	$20,151 14	State and associations, federal government and individuals.		State ⅓; county ⅓; owners.	5,500,000	1,500,000	11,684,360
Idaho	$15,000 00	Not given	State and associations, federal government and individuals.	Assessments	State and owners.		400,000	19,560,625
Utah	None				County	Slight		7,667,585
Minnesota	$75,000 00	State, $25,675.77; Week's law, $10,000.	State or railroads and federal government.		State		43,297 in 1909	1,204,750
Wisconsin	$35,000 and sale of lands; $60,000 for purchase lands.	Any part of appropriation; Week's law, $4,437 25.	State and federal government.		Towns	10,000 (about)	400,000	
Michigan	$10,000 00	$10,000 00	State		State and municipalities.	39,000 in 1909	39,000 in 1909	163,771

New York	$224,544 34	$75,000 00	State in fire towns and individuals.	Individual effort.	State ½; town ½; owners.	7,232,000 in 97 fire towns; includes state and private ownership.		
Pennsylvania	$321,250 00	$25,000 on private land; $5,000 for rangers; $35,000 for foresters; $35,000 for labor.	State	----	State	6,500,000	961,444	
Vermont	$11,000 00	$1,300 00 Week's law, $1,218.	State and owners and federal government.	Voluntary acreage assessment.	Town over 5% of grand list by state.	Total area forest and waste lands, 3,719,000; 800 acres forest land.		
Connecticut	$15,000 00	$1,500.00 for fire fighting. Week's law, $6.	State and federal government.	----	Town ½; county ¼; state ¼.	1,500,000		
New Hampshire	$18,000 00	$12,000 00 Week's law, $6,219.50.	State and association and federal government.	Association assessments on acreage, $10,000.	Town ½; state ½.	4,000,000 acres timber land in state.		
Massachusetts	$49,000 00	$25,000 00 Week's law, $2,500.	State and federal government.	----	Township	2,400,000		
Maine	$65,000 from tax on wild lands.	----	State	----	State and towns.	9,000,000 acres wild land.		
North Carolina	$3,000 00	----	----	----	Owners.			
South Carolina	----	----	----	----	----	5,532,000		

N. B.—The above expenditures made under the Week's law were collected for the year 1911. All other figures given are for the year 1912.

STATE EXPENDITURES FOR FIRE PROTECTION.

From this table it appears that, of California's appropriation, of $7,150, none is spent for fire protection; while Oregon spent, in 1911, $13,788.20, and Washington, $20,151.54. Michigan spent $10,000; New York, $75,000; Pennsylvania, $120,000; Massachusetts, $25,000.

For forestry purposes, New York appropriated $224,544.34; Pennsylvania, $321,250; Massachusetts, $49,000; Wisconsin $35,000, plus the amount derived from the sale of state lands; Maine, $34,000, derived from tax on wild lands; Washington, $38,000; Oregon, $30,000; Connecticut, $20,000; Idaho, $15,000; Vermont, $11,000; Michigan, $10,000; California, $7,150; North Carolina, $3,000.

RESULTS OF FIRE PATROL.

It is true that the damage done by forest fires in California has decreased very rapidly during the past three years. The damage done in 1910, 1911, and 1912, to timber, reproduction and forage in the National Forests, as estimated by the U. S. Forest Service, was, respectively, $332,586.20; $51,000.83; $8,138.81. And the damage to timber alone for these same years was $189,843.00; $7,673.00; $2.217.72. Is there, can there be, any stronger argument in favor of a comprehensive and effective forest fire preventative policy on the part of the State? For, be it remembered, the National Forests are carefully protected, at great expense, by the U. S. Forest Service. And a fire-protective service which reduced, in three years, the total forest fire loss from $332,586.20 to $8,138.81, and the loss in timber alone from $189,843 to $2,217.72 would seem to be well worth while.

FORESTS IN GERMANY.

The German Empire has a total area of 208,800 square miles of land of which area 54,687.5 square miles are timbered. There is much interesting information contained in Circular 140 of the U. S. Forest Service, Department of Agriculture, regarding forest conditions in Germany, portions of which are as follows:

"There is a little over ⅗ acre of forest for each citizen and, though 53 cubic feet of wood to the acre are provided in a year, wood imports have increasingly exceeded wood exports for over forty years, and 300,000,000 cubic feet, valued at $80,000,000 or over one sixth of the home consumption are now imported each year. * * * *

"Like other advanced European countries, Germany felt the pinch of wood shortage one hundred and fifty years ago and though this shortage was relieved by the use of coal, as a fuel, the warning was heeded and systematic State forestry was begun. After all the scare was not a false one, for even today. Germany is not independent as regards wood, since she has to import one sixth of all she uses. * * * *

"The method of management of German forests is regulated so that no more wood is cut than the forest produces. Under this management the growth of the forest and. consequently the amount cut has risen sharply. In 1830 the yield was 20 cubic feet per acre. In 1865, 24 cubic feet; in 1890, 52 cubic feet: and in 1904, 65 cubic feet. In other words Prussian forest management has multiplied the rate of production threefold in seventy-five years. And the quality of the product has improved with the quantity. Between 1830 and 1904 the percentage of saw timber rose from 19 to 54 per cent. Germany received as high as 60 per cent per acre net revenue from her forests. They have ceased to be an expense and are now self-sustaining and a source of considerable profit."

It is a striking fact, in this connection, that in the United States, at the present time, we are annually using about three times as much timber as our forests annually grow. This is in spite of the fact that for several years the market for lumber has been low and as a result logging operations have been curtailed instead of increased.

Logging operations in the redwoods.

UNUSED LANDS ECONOMIC WASTE.

Every acre of land which is not put to some useful purpose constitutes an economic waste. With few exceptions, all of the states have adopted a system for preserving and increasing their timber supply.

There are 1,544,868 acres of cut-over land in this State usually assessed as grazing land, but they yield little or no revenue for the owner. It is believed that, under proper laws encouraging reforestation, there will be thousands of acres of cut-over land donated to the State for reforestation purposes.

The larger the area owned by the State, the cheaper it will be to handle it. The cost per acre for reforestation will be materially lower if the State maintains its own nurseries. In addition to the lower cost, the quality of the trees will be of a higher grade, as care can be taken that diseased trees are not used.

Some of the states have passed laws reducing or abolishing taxes on cut-over lands, with the proviso that the owner of such lands reforest them. The average individual does not possess enough practical knowledge of forestry to enable him intelligently to select and set out trees, so that his attempts are likely to result in a poor and diseased growth.

Logged over redwood land in Mendocino County, showing abundant, natural second growth, which if properly handled would make a fine forest.

Massachusetts has a law, passed in 1908, providing for reforestation. In a report of Mr. R. S. Langdell, Assistant Forester of Massachusetts, for 1910, entitled "Reforestation in Massachusetts," it is stated,

> "Under an act to provide for the purchase of forest land and for reforestation passed by the legislature of 1908, provision is made that private owners may turn tracts of land suitable for reforestation purposes over to the State, to be planted and handled under practical forestry management, and such owners reserving the right to redeem the land at any time within ten years, for the actual amount expended.
>
> "During the year 1909 about 1000 acres were deeded to the State and placed under the supervision of expert foresters from the State Forester's Office, the work being done by local gangs, picked up in the various towns where the lots were situated. The cost of planting, including price of trees and labor of setting, ranged from $5.00 to $10.00 per acre, according to land and labor conditions. A large proportion of the trees used in the work were purchased from outside nurserymen; but in the future, by raising the stock in State nurseries, the above cost of planting should be reduced."

As an example of individual reforestation, attention is directed to the United States Timber Culture Act, repealed some years ago. This act provided that when a claimant to land applied for in conformity with the provisions thereof could show that he had planted trees on each legal subdivision of the tract claimed, he could ''prove up'' and get a patent. No governmental supervision was had nor was there any direction or condition as to what class of trees should be planted nor what was to be done with them after the planting. In consequence of this policy many of the Western prairies are dotted with the skeletons of stunted aspens, cottonwood, greasewood and other like varieties of so-called ''timber.''

In an effort to promote tree planting in California, the Legislature some years ago passed a law (subsection 36, sec. 4041, Pol. Code) providing for the payment by counties to individuals of a sum not to exceed one dollar for each ornamental or shade tree planted along roads. With reference to this act, letters were written to all county auditors of the State asking what had been accomplished under the provisions thereof.

Out of a number of replies received only one—that from the Auditor of Colusa County—stated that there had been any work done under the act and that the last money paid therefor was on August 3, 1910.

Mr. S. J. Flintham, the forester of Los Angeles County, states that no money has been spent under the provisions of said act, but that the county has taken advantage of the act creating the county board of forestry and has thus accomplished the same end in a more effective manner. He goes on to say:

> "The bounty act, it appears to us, would be likely to result in poorly advised planting and lack of uniformity, at very considerable expenditure of county funds—while under our act all roadside planting is under one authority, and opportunity is given to regulate to secure uniformity, proper selection of species and best results. Furthermore, funds are expended not as a bounty to third parties, but for financing planting operations conducted under the directions of the Board itself. With an appropriation of $25,000 this past year, 1911-12 roadside planting has been completed on stretches aggregating 35 miles of the most important roads of the county. It is expected that a further, and we hope, a larger appropriation, will be made available to extend this work during the coming season."

AGRICULTURAL LAND IN NATIONAL FORESTS.

''Conservation of natural resources'' is sometimes briefly defined as ''the maximum use of them with only a minimum of waste.'' This Commission has endeavored to study all of California's natural resources with this definition in mind. It has studied, as well as it could, not only the natural resources belonging to the public, but also privately-owned natural resources, including lands in the National Forest within the boundaries of the State.

The National Forests contain scattered tracts of lands suitable for agricultural purposes. When these lands are ''reserved'' or ''withdrawn'' from the use to which they are best fitted, viz., agriculture, an economic waste results. And this Commission, in common with all other citizens, would like to see such lands restored to entry. Such restorations would be of benefit to the State, to the counties in which they are situated, and to the individuals who acquire possession of them.

But it must not be assumed that all unforested, or even all unforested and rich lands in the National Forests, are capable of producing sufficient agricultural products to put them in the class of "agricultural lands." For conditions of climate, elevation, topography and rainfall or other water supply may be such as to preclude the agricultural use of lands which, under other such conditions, would be very productive.

It is the policy of the U. S. Forest Service to restore to public entry, as fast as may be, all really agricultural lands which may be so restored without injury to the Reserves themselves. The following quotation from the "Rules Governing the General Classification of National Forest Lands and the Segregation of Areas Chiefly Valuable for Agriculture, and Instructions Thereunder," is self-explanatory of this policy of the Forest Service: "A complete and final classification of all lands within National Forests as to their comparative values for forest and agricultural use, and the segregation and listing, under the act of June 11, 1906, of all areas chiefly valuable for agriculture, is an end to be sought for the following reasons: 1. To facilitate the carrying out of the established policy of the Forest Service to open up for settlement and development all land within the National Forests which is chiefly valuable for agriculture. Under this policy the term 'agricultural land' as applied to land within the boundaries of a National Forest is defined as meaning land whose conditions of climate, typography, and soil-productivity positively adapt it to permanent cultivation and the production annually of farm crops in quantities sufficient to justify a reasonable man in undertaking its development."

With this policy of the Forest Service, the Conservation Commission believes, no reasonable man ought to disagree. The National Forests are of the utmost importance to this State. They preserve, on the watersheds of the headwaters of many of our streams, forest cover which serves to regulate the flow in these streams; they conserve great areas of forest lands, which, were it not for the existence of the National Forests, would fall into private ownership and be, first, monopolized and then finally destroyed. Nothing, therefore, should be contemplated or done that will interfere with the integrity and permanence of the National Forests. And under the present policy of the United States Forest Service the segregation and opening to entry, settlement and development of agricultural lands will, no doubt, go on with a sufficient celerity to satisfy the reasonable desires of all men.

WITHDRAWAL OF AGRICULTURAL LAND BURDEN TO COUNTIES.

The Federal statutes now provide that 25 per cent of the moneys realized from the sale of timber in National Forests shall be paid into the treasuries of the counties in which the sold timber is located. This Commission believes that this percentage is not sufficient to reimburse anywhere nearly the counties for the withdrawal from county taxation of the National Forests. The Commission, therefore, strongly recommends that the State of California, by appropriate legislative action, and through its Senators and Representatives in Congress, advocate that 50 per cent instead of 25 per cent, of the moneys received by the United States Forest Service from the sale of timber in the National Forests shall be paid into the treasuries of the counties in which such timber is located.

Ten per cent of gross receipts has been added to the regular 25 per cent and is being used in coöperation with the State and County governments in the construction of roads and trails on the National Forests.

SCHOOL LANDS INVESTIGATION AND DATA.

The Conservation Commission has also collected data relative to school lands. Co-operating with the State Surveyor General, examination of the records in the State Land Office was made to determine what lands, if any, were still owned by the State. The Commission also employed the services of a corps of men, in Washington, D. C., familiar with this class of work to gather data of a similar character at the U. S. General Land Office.

SCHOOL LAND.

With a view to determining the extent, location, and area of school lands, this Commission addressed a communication to Hon. W. S. Kingsbury, the State Surveyor General, and propounded the following questions:

"Will you kindly furnish this office with the following information:

Total acreage school land still owned by State?

Total acreage school land sold?

Total acreage school land granted to State?

Approximate acreage school land within unsurveyed townships not yet listed to State?

Total acreage still owned by State under swamp land grant?

Total acreage owned by State under other grants? Give each grant separately.

Has any examination been made to ascertain the character and value of the state lands?

If so, please state the extent of such work and where such information may be obtained.

Is school land first appraised before it is sold?

Upon what terms is it sold?

At what price and under what conditions are the other state lands sold?

Are these lands first appraised?

Can the State lawfully refuse to sell any of its lands, or must it sell when proper application is made?

As much of this information as you can supply before September 15th, the date of our next meeting, will be greatly appreciated, since the Commission would like to consider these questions at that time."

Mr. Kingsbury, in reply to our inquiry stated that:

"The acreage of school land granted to the State, acreage sold, and acreage still owned by the State, has never been tabulated. * * * *

The State has sold all swamp land with the possible exception of a very few isolated tracts.

The only lands granted to the State which remain unsold are the school lands.

No examination has been made to ascertain the character and value of the state lands.

No lands are appraised before they are sold.

The school lands must be sold, under the present law, at $2.50 per acre when proper application is made. * * * *

If there is any timber on the land, it goes with the land without additional charge. There is, at present, no known timber land."

Mr. Kingsbury in his communication also stated that until certain matters are adjusted "it will be impossible to make even the roughest kind of an estimate of the amount of land owned by the State."

Owing to the condition of the records of our State Land Office, and the methods which, prevailing long before Mr. Kingsbury became

Surveyor General, undoubtedly caused this confusion and uncertainty, the Commission determined to ascertain, if possible, what lands, if any, the State still owned. And, in order that, if valuable land was discovered, it would not be practically given away for the nominal sum of $2.50 per acre, the Commission recommended to the last extra session of the Legislature the withdrawal from sale of state lands until September, 1913; and the recommendation of the Commission became a law.

As a result of the investigations made under the direction of this Commission, greatly aided by Mr. Kingsbury, of the official records of the Federal Government, the Commission has been able to approximate the total amounts of land still owned by or due the State, and has prepared a map showing the geographical locations, and as near as possible, the area of such school lands. The map referred to is numbered Exhibit "C" and is attached to this report. A tabulation giving the status of each section 16 and 36, in which the State has an apparent claim to all or a portion thereof, is shown upon the following pages. The only purpose of this map and the tabulation is to give a general idea of the geographical location and area of the state lands.

The tabulation showing the location and area of each section in which the State may have an interest, and also whether or not the land is within or outside a National Forest Reserve, is appended hereto and marked Exhibit "D."

We do not desire to assert that this tabulation or description of the school lands appended hereto is entirely free from error, because, in a few instances, since the preparation of the table, we have found certain discrepancies. This is due, however, to the condition of the old records in the office of the State Surveyor General. But, as stated before, the purpose of this investigation and inventory was not to make an absolutely exact check, but merely to determine approximately the area, if any, of state lands still in the State's possession. And, in view of the tabulation made, we are confident that the State still owns approximately one million acres of school lands.

LETTER OF CERTIFICATION.

The following letter certifying to the apparent and probable correctness of the data gathered at Washington in regard to the California school lands is self-explanatory:

(COPY)

UNITED STATES DEPARTMENT OF THE INTERIOR.
GENERAL LAND OFFICE.
WASHINGTON, D. C., April 22, 1912.

State Conservation Commission,
State of California,
Mills Building, San Francisco, Cal.

SIRS: In furtherance of the adjustment of the California School grant, representatives of the State, acting with officials of this office, have examined the records of the office pertaining to said grant, and have prepared a tabulation, in triplicate, therefrom, showing the present status of the grant, pending unapproved selections being excepted. The records were carefully examined and checked, and the data obtained and tabulated is believed to show correctly the status of the grant. It must not be considered, however, that such statements, while deemed to be accurate, are to taken as conclusive and as forbidding subsequent ascertainment and correction of errors.

Very respectfully,

(Signed) S. V. Proudfit,
Assistant Commissioner.

CONDITION OF SCHOOL LANDS.

The compilation showing the status of the California school land grant as secured from the records of the State and Federal departments shows:

	Acres.
Sold by State	2,833,205.33
Selections made prior to March 1, 1877	587,778.22
Selections made subsequent to March 1, 1877	576,867.06
Excess selections subsequent to March 1, 1877	3,228.94
Land in place claimed by the United States, act March 1, 1877	14,590.43
Reconveyed to United States	12,000.00
Total disposals by the State of California	4,027,669.98
Area due the State of California under school land grant (surveyed and estimated)	5,252,143.19
Area due (353 townships unsurveyed and unestimated), approximately	447,360.00
Total area due the State of California	5,699,503.19
Area due the State of California	5,699,503.19
Total area disposed of by State	4,027,669.98
Balance due the State	1,661,833.21
Pending unapproved selections	486,768.55
Total area undisposed of	1,175,064.66
Excess selections, prior to March 1, 1877	17,945.20
Payment claimed by the United States for excess selections prior to and under the provisions of the act of March 1, 1877, at the rate of one dollar and twenty-five cents per acre	$22,431 50

DOUBLE SALE OF LANDS BY STATE.

The lack of system formerly existing in the State Surveyor General's office has, in not a few instances, resulted in the State selling, to citizens entitled to purchase, lands which, through prior transactions, the State had already disposed of to other applicants. This may result in much litigation as well as in hardship to bona fide purchasers, who, in some instances, may even be deprived of their homes and the improvements made upon these lands which they have made in good faith upon the assumption that the State was not selling then an imperfect and defective title. Under the present law all that these settlers may be able to recover from the State is the amount of the purchase price of the land, but nothing for money or time expended, in good faith, upon the land. And while it must be admitted that this amount will not fully satisfy the injury and losses, still it is very difficult for this Commission to suggest a proper remedy and adequate relief.

EXAMINATION AND APPRAISEMENT OF STATE LANDS.

We do not submit a bill providing for the disposal of our remaining school lands, for the reason that, until an examination and appraisement has been made of these lands, it would be impossible to submit a proper measure having to do with the disposition of lands, the character and value of which are entirely unknown. For that reason we believe that for the next two years these lands should be withheld from sale; that they be examined and determination be made as to what portions thereof should be sold and what portions retained by the State for transfer to the United States in lieu of lands in a compact body which the State might be able to exchange therefor to be used as a State Forest Reserve.

MINERAL LANDS.

The subject of mining, embracing dredging, oil, placer and quartz locations, presents many complications. In considering the abuses existing in the present mining laws and what is required to rectify such abuses, it is necessary that the opinion of practical miners and mineral experts should be secured. And in furtherance of the Commission's policy first to hear all persons interested, recommendations will be deferred until further hearing and more definite investigations shall have been made. But it should not be forgotten that the Federal Government, rather than the States, has power in such matters.

It has been arranged by this Commission to coöperate with Mr. W. H. Storms, the State Mineralogist, in the preparation of an outline for remedial mining legislation. Meetings with bodies of men representing oil and other mining interests, should be held in the near future, and at these meetings efforts should be made to frame a law which will develop rather than retard the growth of this great industry. An attempt should also be made to discuss all the various methods of the opening and developing of mineral lands. Steps ought also to be taken to protect oil-bearing sands from being flooded with water; to prevent unnecessary waste of natural gas; to provide for the filing of location notice of mineral in the United States Land Office within the district in which such mining location may be situated; to prevent the speculative location of mining claims, and generally to treat upon all matters pertaining to this subject in which the State has any power or influence.

A supplementary report on this project will be submitted for your consideration as soon as these hearings have been held and further investigations made.

GOLD DREDGING.

At the request of the Commission, Dr. Charles B. Lipman, of the U. S. Agricultural Department Experiment Station at Berkeley, very kindly made an examination of the lands around Oroville, California, affected by the gold dredging. Dr. Lipman's report, annexed hereto and marked Exhibit "E" contains the result of his examination into the subject.

Because of a press of other and apparently more important duties, the Conservation Commission has been unable to organize and prosecute a sufficiently thorough and complete investigation of the relation which gold dredging bears to the public welfare to enable it to formulate and regulatory recommendations therefor. The Commissioners have, however, visited the scenes of the dredging operations, and in common with all other persons not directly interested in them, have been unfavorably impressed with the destruction of land produced by these operations.

The Commission has no hesitancy in saying that the State should not ermit, if it can prevent it, the destruction in any manner, for practi-ally all time, of large areas of agricultural land. It may be true that uch destruction will produce more immediate wealth than the continued se, for even centuries, of such lands. But the wealth produced by redging is not and cannot be so valuable to this State as the even far ess wealth annually produced by any agricultural lands ruined by redging or any other operations.

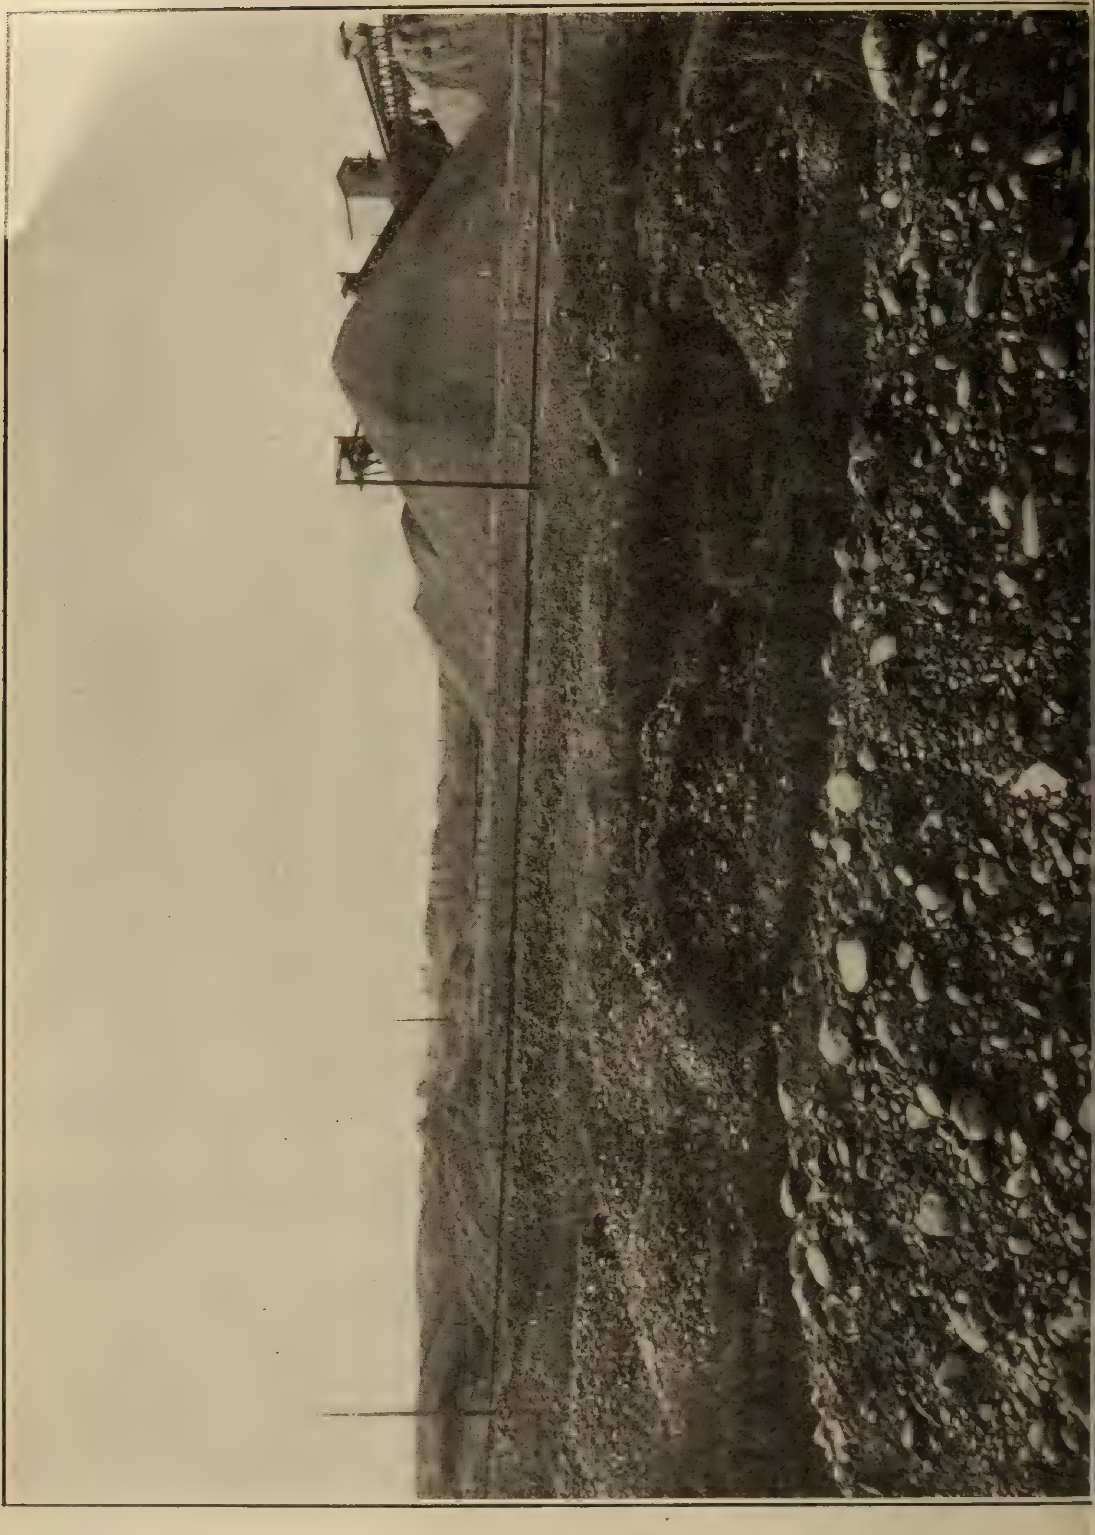
The dredging operations, it is true, give employment to many men—nany more than could be given employment at any one time on he same land if it were retained for agricultural purposes. But gold redging is ephemeral—it can last but a few years—and when it is inished, the land, being comparatively useless, can give but little or no mployment for a very long time. Agricultural land, on the other and, gives employment practically forever and furnishes not only vealth but the necessities of life to others than those who themselves se it. It is also true that not all the dredgable land is agricultural n character; but a large acreage of it is.

According to Dr. Lipman's report, there are about 20,000 acres of roved dredging ground already in the possession of the dredging ompanies on the Feather and Yuba rivers; and the companies own omething over 12,000 other acres of, as yet, unproved lands.

The question at issue is whether it is of more benefit to the present and future of this State to permit any considerable area of its territory to be ruined and become an eyesore in order that, for a few years, even the enormous sum of over $7,250,000—the output from dredging operations for 1909—shall annually be added to the wealth, not of this State but of this nation. For, although it is true that a great portion of the output of the dredging operations is paid out in this State for labor, supplies and material, it must not be forgotten that the actual profits go largely to other states, and that, when the dredging operations shall have ceased, the production of wealth from the dredged lands will cease. If it shall be deemed advisable to permit 1,000 acres to be ruined, why not 100,000 acres—why not the greater part, the whole, of the State?

HYDRAULIC MINING REGULATED.

The operation of hydraulic mining in this State was regulated because, among other bad results, it was causing the destruction of large areas of agricultural land. The regulation consisted in compelling those who desired to mine by hydraulic power to keep their slickens from falling into and choking the rivers. The result of the hydraulic mining was the annual production of a far greater amount of gold than can be hoped for as the result of dredging operations. The hydraulic mining operations were, nevertheless, regulated, and the regulation was of such a nature as to stop practically all hydraulic mining operations. The consensus of opinion was that, even if the annual production of gold from the hydraulic mines was far greater than the value of the annual products from the agricultural lands the slickens were destroying, it was better public policy to



suspend the hydraulic mining than to permit the destruction of agricultural lands.

DREDGING DESTROYS LAND.

The dredging operations as now conducted turn the land upside down, putting the top soil at the bottom and the bottom cobbles on top of the spoil heaps. The result is, of course, that the productivity of the land is practically destroyed. From observation of the dredging operations, the Conservation Commission is of the opinion that these operations may be conducted in such a way that the material may be run through the dredges and the spoil deposited in such a manner that the soil may be on top and the cobbles at the bottom. It is true that this method would be more expensive than the dredging method now pursued—in many instances it would be prohibitively expensive. But, in the case of the hydraulic mining operations, the question of the expense of methods providing for the preservation of agricultural lands was not considered—the safety sought for being the only consideration involved.

THE ÆSTHETICS INVOLVED.

This question is also one to be considered, in conjunction with that of economics, from the æsthetical standpoint. Is it of sufficient profit to this State to permit the spoliation of large areas of land and the turning of them into hills of unproductive scenery-marring cobblestones? True, even the by-product of cobblestones may be, is, being crushed and used for road material. But are even the profits to the dredges and needed road material to some of the people of this State sufficient to outweigh the damages done in other directions to the present and future generations of California?

REPORT FROM AUSTRALIA.

From "Gold Dredging in California," Bulletin No. 57, issued by the California State Mining Bureau in 1910, page 246 under the heading "Reclaiming Dredged Land," the following quotation is in point:

> The following extracts from the papers and reports of the Minister of Mines, New Zealand, John Hayes, inspecting engineer, (page 16 c 3) 'There has been an outcry in some quarters about valuable land being destroyed for agricultural purposes by gold dredging operations. This has undoubtedly been the case in a few instances, but in others, where swampy marsh land has been dredged the effect has been to drain and sweeten it and it is now growing sweet grass and clover where rank sour grass and rushes grew before. At the same time it cannot be claimed that this land has been left in anything like as good a condition as it might have been had advance stripping been practiced, and the soil and subsoil, etc., deposited on the gravel tailing instead of them all being mixed up as at present.' "

No. 2 District A. R. Campbell, inspector:

> "An Omeo dredge is making a good show in regard to resoiling, this being mainly attributable to the depth and nature of soil dealt with. This soil is stripped in advance and sluiced down the box with the full body of water, but owing to the tenacity of the material, a fair quantity of it stays on the tailing, the deposit being in some places four feet deep."

The Commission would, however, suggest that it is entirely within the police power of the State to regulate these dredging operations. It may even be possible to regulate them under the law of nuisances without any further legislative action.

OIL.

The production of natural oil in California was, last year, 84,648,157 barrels, valued at $40,552,088. It, therefore, ranked first in oil production. Oil, being by decision of the courts a mineral, it becomes subject to exploitation only under the provisions of the federal laws. It appears, moreover, that much of the most valuable oil lands in this State were acquired under congressional land grants by the Southern Pacific. But, in express and unmistakable terms, whatever minerals might be found on, in or under these lands were excluded from the deed of gift. The Southern Pacific has, however, proceeded to extract from these lands natural oil and put it to its own use. It has also sold large tracts of these lands to others who have proceeded to take oil therefrom. Such acts on the part of the corporations are apparently in defiance of the law; and those taking oil from such lands, except under the federal laws governing the right to take minerals from public lands, are trespassers on the public domain. The State cannot, of course, take any action to prohibit such acts; that power rests only with the Federal Government, which has brought suit to recover the mineral lands thus acquired by the Southern Pacific.

Complaint is made, by certain of the producers of oil in this State that, because of the acts of certain other producers, water overlying oil sands is permitted to enter and injure those sands and to interfere with the extraction of oil from them. There is already on the statute books of this State a law prohibiting this injury. It is claimed, however, that this law is inoperative. The Conservation Commission recommends that the present law be amended so as to make it operative.

NATURAL GAS.

There are enormous quantities of this very valuable natural resource being unnecessarily wasted in this State. Two years ago, the Legislature passed an act prohibiting the unnecessary wasting of natural gas. But, in spite of the fact that the Conservation Commission called the attention of the district attorneys in the oil-bearing counties to this law, nothing, so far as this Commission has been able to ascertain, has been done to stop this unnecessary wasting of this very valuable natural resource. The value of the gas wasted in 1910 was, according to the statement of Mr. L. M. Aubury, then State Mineralogist, $2,000,000.

The Conservation Commission is strongly of the opinion that the unnecessary wasting of natural gas, especially through abandoned wells, should not be permitted. It is true that, to stop this waste, would require the expenditure of some, but not, in any one case, an excessively large sum of money. And, the Commission believes, no person should be permitted to search for or extract our natural resource, oil, in the hope of or to his own profit and, by reason of that hope or its realization, so to conduct his operations as to waste unnecessarily another valuable natural resource, towit, natural gas, even if the prevention of that waste does cost the searcher or the profit-maker some money. The prevention of that waste should be one of the recognized possible costs of all boring of wells, productive or non-productive, in the oil fields of California.

FISH AND GAME.

Fish and game are natural resources of great value, from the standpoint of food supply, and healthful amusement. It is the duty of the State to conserve and preserve these natural resources in every possible way for the benefit of all the people. Proper fish and game laws, strictly enforced, and fish hatcheries and game farms are necessary for this conservation and preservation.

LAKE TAHOE.

Approximately three fourths of the superficial area of Tahoe lie in California—the remaining fourth in Nevada. Its outlet, the Truckee River, begins in California, but soon enters Nevada. On the Truckee River in California are many plants using water power; and there is room for other similar California plants on the river. By means of a tunnel the waters of the lake may be put to power and irrigation use for and in the Sacramento Valley. This lake is also one of California's most beautiful and celebrated spots and places of resort; and, from every standpoint, is one of our most valuable natural resources.

TAHOE SHOULD BE CONSERVED.

California, therefore, should see to it that this lake is conserved for California, at least in the proportion of its water supply that lies within this State. The Conservation Commission is, therefore, very greatly interested in the attempts that have been made and are still being made by the United States Reclamation Service to secure for the Fallon Reclamation Project, in Nevada, a larger portion of the waters of the lake than, naturally and subject to California rights, discharges from it through its natural outlet, the Truckee River.

PLANS OF RECLAMATION SERVICE.

Only a short time ago, the U. S. Reclamation Service endeavored to secure the participancy of the United States Government in a contract with a power corporation, under which contract, by means of a tunnel tapping the lake in Nevada, water was to be taken from the lake, used for power purposes in Nevada and for irrigation purposes on the Fallon project, also in Nevada. Believing that such an arrangement, attempted without consulting the State of California, would be a distinct detriment to the people of this State, the matter was brought to the attention of Governor Johnson. The Governor protested vigorously to the President of the United States, and the proposed contract was abandoned. The Reclamation Service it appears, has, however, not ceased its efforts to take and use the waters of the lake on its Nevada reclamation project. It now proposes, it appears, to enter into some sort of an arrangement or contract with the parties claiming ownership of and regulatory powers over the dam at the source of the Truckee River, whereby the amount of water leaving the lake may be regulated for the benefit of the Fallon Project.

THE DAM AT THE SOURCE OF THE TRUCKEE.

The dam at the source of the Truckee was built by private parties under authority of an act of the California Legislature, passed in 1870. This act limited the right of occupancy to twenty years from the date of the proof of the expenditure of $25,000 on construction work. This proof was made in 1875. The right, therefore, expired in 1895. But the State did nothing to take from the persons claiming ownership of the dam the right to maintain and operate it. It appeared, therefore, as if those controlling and operating it might secure, by prescription, perpetual rights to maintain and operate this dam, unless suit were brought to determine the right. The matter was brought to the attention of Attorney General Webb by the California Water Commission and this Conservation Commission. But before he could take action, suit was brought by certain interested private parties in California to have declared terminated the right of those claiming possessory title to the dam. In this suit the Attorney General, representing the State, has intervened.

STATE SHOULD SUE TO HAVE WATERS PARTITIONED.

In the opinion of the Conservation Commission—which is shared by the State Water Commission—the waters of Lake Tahoe are too valuable an asset, from every point of view, to permit them to be diverted, without established limit, into any other state. For, if they be so diverted, it will be difficult, if not impossible, for California to recover her proper share of them. The Conservation Commission, therefore, recommends, as strongly as it can, that this State bring suit, before the Supreme Court of the United States, against the State of Nevada to have the waters of Lake Tahoe equitably apportioned to and between the two states, so that, by prescription or otherwise, the people of California may not be deprived of their present just, legal, equitable, and proper share in the waters of the lake.

STATE SHOULD OWN AND CONTROL DAM.

No private interest should be permitted to own and operate the dam at the source of the Truckee River. Such private ownership and control, paying attention only to the demands for water for its own purposes, will, of course, manipulate the dam with no voluntary regard to the rights and privileges of the owners of littoral lands on the lake or of other parties on the river. The power to do that should not be entrusted to any private parties, no matter how benevolent. As above mentioned, the right to maintain and operate the dam expired, by legislative limitation, a long time ago; and, it is believed, the private parties now operating the dam have acquired no prescriptive or other rights to continue to use and operate it. The waters of the lake and the river are used and, in the future, will be still more used by Californians with diverse and adverse interests. These constantly increasing interests should not be at the mercy of any one interest adverse to all the rest. No private person or corporation should be longer permitted to maintain and operate the dam at the source of the Truckee River, with the power to regulate, for its own profit and to the probable detriment of everybody else, the flow of water from the lake and, therefore, the level of the water in the lake.

COMMISSION RECOMMENDS STATE CONTROL OF DAM.

It is true that any person injured or damaged by the act of those in control of the operation of the dam may sue for recovery of compensation for any injury or damage suffered by reason of an improper use of the dam. But the Conservation Commission believes that it is against public policy to permit any private interest to control the operation of a dam by which the level of the waters of the lake can be raised or lowered, to the discomfort, if not the actual injury or damage, of the littoral owners on the lake. Such a power should be only in the hands of the State, the representative of all those having adverse interests on the lake and the river in California. In this way, and in this way only, the Commission believes, can the adverse rights of all persons concerned be best conserved. This Commission, therefore, earnestly recommends that the State take all possible steps for the ousting of the private parties from the control of the dam at the source of the Truckee River, and that it assume the maintenance and operation of the dam.

WASTING OF ARTESIAN WATER.

In some portions of this State flowing wells are permitted to go uncapped, even when the water is not being put to beneficial use. The result is that the underground reservoirs from which these wells derive their supply are depleted and those using water from them in localities above the uncapped wells are deprived of water for irrigation and other purposes. The wasting of water in this manner is an inexcusable act and an economic loss which should not be tolerated. There is on the statute books of this State a law prohibiting this waste. But for some reason or other the district attorneys of the counties in which these wastes are being permitted have taken no steps, so far as this Commission has been able to ascertain, to enforce this very salutary law. Its enforcement is necessary to the public good. The waste is against public policy, unnecessary, easy and cheap of abatement, and an injury to others far removed from the seat of the wastage. The Conservation Commision strongly urges that this law be enforced or amended so that it may and will be enforced.

IRRIGABLE LANDS IN CALIFORNIA.

Any process by which the fertility of our lands may be increased, or by which non-producing lands may be made productive, is, from the standpoint of the conservation, of the greatest importance.

On account of the small and uncertain rainfall in many and large portions of this State, irrigation is necessary. By means of irrigation large areas have been made far more productive than they were before; large areas of non-productive lands have been made very productive, and there are still other large areas of small-productive and non-productive lands which may, by irrigation, be made largely, even enormously, productive. Parts of southern California, including Imperial County, and the Sacramento and San Joaquin valleys are illustrative of all these conditions. It is not at all a wild statement to say that there is irrigable land enough in this State to accommodate, in plenty and prosperity, a population of 30,000,000 rural people. Nor is it at all beyond the certainties of the future that millions of American families will be raised, in comfort and luxury, on irrigated California farms of five and even less acres. In this manner, the Conservation Commission believes, will be solved, as well as it may be solved, the problem of the drift to the cities of the country population, upon which depends the conservation of human life, comfort, prosperity and happiness.

INVESTIGATION OF IRRIGABLE LANDS.

The Conservation Commission, therefore, deemed it to be its duty, under the provisions of the act creating it, to investigate, as well as it could in the short time at its disposal, the location and area of the irrigable lands of the State and the sources from which those lands may be irrigated. The Commission, therefore, entered into a coöperative agreement with the U. S. Department of Agriculture for the purpose of gathering these data. The results of that agreement are attached hereto in the forms of reports on and maps of the several divisions into which, for the purposes of the investigation, the State was divided. These reports and maps, the Commission believes, are of great value, and will greatly aid the population of areas of California which are now only sparsely, if at all, inhabited.

WEEKS LAW.

On March 1, 1911, Congress passed a law (see Chap. 186, U. S. Stat.) entitled "An act to enable any state to coöperate with any other state or states, or with the United States, for the protection of the watersheds of navigable streams, and to appoint a commission for the acquisition of lands for the purpose of conserving the navigability of navigable rivers."

By this act the sum of two hundred thousand dollars was appropriated "to enable the Secretary of Agriculture to coöperate with any state or group of states, when requested to do so, in the protection from fire of the forested watersheds of navigable streams." The law further provides: "That no (such) stipulation or agreement shall be made with any state which has not provided by law for a system of forest fire protection. That in no case shall the amount expended in any state exceed in any fiscal year the amount appropriated by that state for the same purpose during the same fiscal year."

This act is administered, as therein provided, through the Department of Agriculture, but more directly by the United States Forest Service, and all matters connected with the question as to whether or not a state is entitled to the use of any portion of the sum appropriated by said act, are acted upon by the Secretary of Agriculture on the recommendation of the district forestry in the state asking federal aid under this act. Rules and regulations of the department have been framed and promulgated, under which the federal officials act.

RESULT OF "WEEKS LAW" IN OTHER STATES.

The following table sets forth the states which received federal aid under the "Weeks Law" in 1911, the amounts expended under its provisions by the Federal Government in each state, together with the amounts expended by each of the states then receiving federal aid:

State.	State expenditures.	Federal expenditures.	Allotment to states.	Balance of allotment unexpended.
Maine	$23,557 07	$9,991 80	$10,000 00	$8 20
New Hampshire	13,876 21	6,219 50	7,200 00	980 50
Vermont	2,243 90	1,218 00	2,000 00	782 00
Massachusetts	400 12	365 00	1,800 00	1,435 00
Connecticut	513 96	6 00	1,000 00	994 00
New York	3,837 59	2,000 00	2,000 00	----------
New Jersey	1,241 50	990 00	1,000 00	10 00
Maryland	262 85	261 00	600 00	339 00
Wisconsin	20,841 87	4,437 25	5,000 00	562 75
Minnesota	25,675 77	10,000 00	10,000 00	----------
Oregon	8,758 89	3,305 00	5,000 00	1,695 00
Totals	$101,209 73	$38,793 55	$45,600 00	$6,806 45

Of the $200,000 appropriated by the U. S. Government for use in the various states, there remained unexpended, on January 1, 1912, the sum of $161,206.45.

The Conservation Commission earnestly recommends that the State, by complying with the provisions of the "Weeks Law" and appropriating at least the sum of $10,000, avail itself of the provisions of that law and thus secure, for forest protection purposes, federal aid to the extent of that sum.

The gist of the "Weeks Law," under which, if the State appropriates money for the protection from fire of watersheds and navigable streams and their tributaries, it will receive from the Federal Government a like sum up to and not to exceed, under the rules of the Secretary of Agriculture, $10,000 per annum, is attached hereto.

IRRIGATION.

The Commission entered into the following coöperative agreement with the United States Department of Agriculture:

UNITED STATES DEPARTMENT OF AGRICULTURE,
OFFICE OF THE SECRETARY.

Agreement Relating to Coöperative Irrigation Investigations.

This Agreement, made and entered into this first day of July, one thousand nine hundred and eleven, by and between the Conservation Commission of the State of California, for and on behalf of the State of California, party of the first part, and the Acting Secretary of Agriculture, for and on behalf of the Department of Agriculture of the United States of America, party of the second part.

Whereas, the party of the second part has been conducting irrigation investigations in California during a period of eleven years and has accumulated a large amount of information relating to water, the use of water, and irrigation in said State, and will continue to maintain in said State an expert field force and gather additional information along the same lines during the fiscal year 1912; that is to say, commencing July 1, 1911, and ending June 30, 1912; and

Whereas, in an act entitled "An act creating and establishing a commission for investigating and gathering data and information concerning the subjects of forestry, water, the use of water, water power, electricity, electrical and other power, mines and mining, mineral and other lands, dredging, reclamation and irrigation, and for revising, systematizing and reforming the laws of this State upon, concerning, regarding, or appertaining to these said subjects; providing for the appointment of said commission to be known as the 'Conservation Commission of the State of California;' prescribing the powers and duties of said commission and its members, and providing for the expenses of said commission and appropriating money therefor," approved April 8, 1911, the legislature of California has created a Conservation Commission for the purpose of investigating and gathering data and information regarding, among other things, the subjects of water, the use of water, and irrigation, and said Conservation Commission desires to present promptly to the people and legislature of California full information on water, the use of water, and irrigation in said State, as provided in said act; and

Whereas, the party of the second part desires to extend and enlarge its investigations of the water and irrigation conditions and possibilities in the State of California, as related to agricultural development; and

Whereas, the party of the first part is desirous of having the party of the second part aid said party of the first part in gathering data and information concerning irrigation in the State of California with a view to enabling the party of the first part to make full, accurate and complete reports thereon, and the party of the second part wishing to assist the party of the first part in conducting such work with a view of enabling the party of the second part to extend, enlarge and complete the irrigation investigations which said party is conducting relative to making reports on the present extent and future possibilities of irrigation in California and the prompt preparation of such reports in form for publication, using therefor such data and information as are now in possession of the party of the second part, or that may be collected by said party of the second part during the existence of this agreement; now, therefore,

This Agreement Witnesseth:

First. The party of the first part, for and in consideration of the promises and agreements of the party of the second part, well and faithfully executed in the manner as hereinbefore provided, does hereby promise and agree with the party of the second part as follows:

1. To coöperate with the party of the second part in gathering data and preparing a report on water, the use of water, and irrigation with particular reference to the present extent and future possibility of irrigation in California.

2. To contribute to the expenses incurred in gathering the data and preparing the reports as provided for in this agreement during the period commencing with the first day of July, one thousand nine hundred and eleven, and ending the thirtieth day of June, one thousand nine hundred and twelve, a sum not to exceed ten thousand

dollars ($10,000.00), including salaries, and expenses of travel and subsistence, when the same are authorized by the party of the second part, or the representative of said party by the party of the first part; provided, that all moneys paid by the party of the first part hereunder shall be used for the specific purposes set forth in this agreement, and that the investigations made and the reports prepared hereunder shall be in addition to the investigations made and reports prepared and published under the coöperative agreement existing between the party of the second part and the Engineering Department of the State of California. All claims for expenses incurred and work performed by said employees shall, from time to time, be presented and filed with the party of the first part, audited, and, if found correct, approved by the party of the first part.

Second. The party of the second part, for and in consideration of the promises and agreements of the party of the first part, well and faithfully executed in the manner as herein provided, does hereby promise and agree with the party of the first part as follows:

1. To extend and enlarge the investigations which said party is conducting during the fiscal year 1912, beginning July 1, 1911, and ending June 30, 1912, for the purpose of determining the present extent and future possibilities of irrigation in California and for preparing reports thereon in such manner as to set forth what the present extent and future possibilities of irrigation in California are, including, (*a*) a statement of the water supply of California, both surface and underground, available for irrigation; (*b*) a statement of the extent, character, and location of the agricultural areas susceptible of and adapted to irrigation; (*c*) a statement of the present extent of irrigation in California; (*d*) a statement of the extent and location of the unused waters available for irrigation extension, and (*e*) an irrigation map of California.

2. To contribute to the expense of the above-mentioned investigation and reports from the moneys appropriated by Congress for "Irrigation Investigations," 1912, during the period from the first day of July, one thousand nine hundred and eleven, to and including the thirtieth day of June, one thousand nine hundred and twelve, the sum of one thousand dollars ($1,000.00), in addition to any moneys expended by the party of the second part under the coöperative agreement entered into by said party with the Engineering Department of the State of California; including the salaries of employees, expenses of travel and subsistence, when the same are authorized by the Secretary of Agriculture, and the cost of preparing, illustrating, and printing the above-mentioned reports.

Third. It is mutually understood and agreed by and between the parties hereto as follows:

1. That in the event that any question shall arise between the parties hereto as to the meaning of this instrument, the provisions of said act of the legislature of the State of California, approved April 8, 1911, hereinbefore referred to, as far as applicable, shall control.

2. That the Secretary of Agriculture may, from time to time, delegate to any officer or person in the employ of the United States Department of Agriculture, with the same effect as if such officer or employee were specifically named herein, every right and power hereby conferred upon the said Secretary of Agriculture, and until the party of the first part shall be advised in writing to the contrary, every right and power conferred upon the said Secretary of Agriculture shall be deemed to be delegated to the Director of the Office of Experiment Stations, of the United States Department of Agriculture, or the representative of said Director.

3. That such complete typewritten reports of the investigations carried on under this agreement as shall be made shall be filed from time to time with the Conservation Commission of the State of California as may be required by said Commission.

4. That the results of the coöperative work are to be the joint property of the parties hereto and either of the parties may publish such results, provided proper credit be given to the other party for its part in the work, and provided further, that any matter to be published by either party be submitted to the other party before publication.

5. That this agreement shall take effect on the first day of July, one thousand nine hundred and eleven, and shall expire on the thirtieth day of June, one thousand nine hundred and twelve.

6. That this contract shall not be assigned in whole or in part; that no Member of or Delegate to Congress, or Resident Commissioner, after his election or appointment, and either before or after he has qualified and during his continuance in office, and no officer, agent, or employee of the Government, shall be admitted to any share or part of this contract or agreement, or to any benefit to arise thereupon; and that

no convict labor shall be employed in carrying out the terms of this agreement, in accordance with executive order signed May 18, 1905. Nothing, however, herein contained shall be construed to extend to any incorporated company, where such contract or agreement is made for the general benefit of such incorporation or company (section 3741, Revised Statutes, and sections 114-116, act of March 4, 1909).

In Testimony Whereof, the parties hereto have executed this agreement on the day, month and year first above written.

CONSERVATION COMMISSION OF THE
STATE OF CALIFORNIA.
(Signed) GEO. C. PARDEE.
Party of the first part.
(Signed) W. W. HAYS,
Acting Secretary of Agriculture,
Party of the second part.

In accordance with this agreement, the Department has furnished us with reports showing the result of this investigation to date. The following letters of transmittal and submission explain the field covered by the coöperative agreement and outline additional reports in preparation:

LETTER OF TRANSMITTAL.

U. S. DEPARTMENT OF AGRICULTURE,
OFFICE OF EXPERIMENT STATIONS.
WASHINGTON, D. C., October 15, 1912.

HON. GEO. C. PARDEE, *Chairman*,
Conservation Commission of the State of California,
Sacramento, California.

SIR:

I transmit herewith three reports on the irrigation resources of California, prepared under the supervision of Samuel Fortier, Chief of Irrigation Investigations of this office, by Mr. Frank Adams, in charge of the irrigation investigations of this office in California, and his collaborators, S. T. Harding, R. D. Robertson, and C. E. Tait, in accordance with a coöperative agreement between the Secretary of Agriculture and your Commisssion, dated July 1, 1912, which makes the results of the work the joint property of the Department and your Commission.

Respectfully,

(Signed) A. C. TRUE, Director.

LETTER OF SUBMITTAL.

U. S. DEPARTMENT OF AGRICULTURE,
OFFICE OF EXPERIMENT STATIONS,
IRRIGATION INVESTIGATIONS.
WASHINGTON, D. C., October 15, 1912.

DR. A. C. TRUE,
Director, Office of Experiment Stations,
Department of Agriculture.

SIR:

Herewith are transmitted three reports on the irrigation resources of northern, central, and southern California, prepared in accordance with the coöperative agreement between the Secretary of Agriculture and the Conservation Commission of California, dated July 1, 1911. Accompanying the reports are three irrigation maps, also covering the northern, central, and southern portions of the State.

It is recommended that these reports and maps be forwarded to the Conservation Commission in accordance with the clause in the above-mentioned coöperative agreement making the results of the investigations the joint property of the Department and the Commission.

In presenting these reports covering a portion of the work carried on, it is not intended to submit a complete engineering or agricultural discussion of the extensive land and water resources of California, but rather what might be termed preliminary reconnaissance reports that will give to the people of California generally a clear outline of irrigation conditions and possibilities in each agricultural area of the State.

The methods and scope of the field investigations are indicated in the preliminary pages of the report on northern California. Each valley agricultural area in the State, with the possible exception of very small and unimportant isolated areas in the mountains, has been visited and mapped to show the valleys, plains, and foothill-belt areas, the lands now irrigated, and the principal irrigation canals, the mapping being based on reconnaissance observation rather than on exact surveys.

In addition to the reports and maps submitted herewith, this office has at hand more detailed reports, with maps, dealing with present irrigation development in six typical sections of the State, viz: Shasta Valley, the Sacramento Valley areas to which Feather River is tributary, the valley of San Joaquin River and tributaries, the portion of Santa Clara Valley, in Santa Clara County, watered by Los Gatos, Guadalupe, and Campbell creeks; the valley of Santa Clara River, in Ventura County; and the valley of Santa Ana River, in San Bernardino, Riverside, and Orange counties.

It is our intention, in accordance with our understanding with the Commission, to prepare a publication summarizing these detailed reports and also summarizing the three reports on irrigation resources transmitted herewith for publication by the Conservation Commission. This summary report will carry also the full irrigation map of the State and the more detailed maps of the six typical sections referred to above.

In submitting our various reports of work done in coöperation with the Conservation Commission it is due that we give credit to the State Engineering Department of California for data used in these reports that have been gathered at the joint expense of that Department and this office during the past ten years; to the United States Bureau of the Census, with whom we coöperateed in taking the irrigation census of California; and to the following field agents, Harry Barnes, S. H. Beckett, R. W. Broadie, J. N. Irving, J. T. Kingdon, J. C. Marr, R. V. Meikle, F. W. Stanley, E. W. Stanton, Jr., N. M. Stover, A. J. Salisbury, Jr., and S. C. Whipple.

Respectfully,

(Signed) SAMUEL FORTIER.
Chief of Irrigation Investigations.

IRRIGATION RESOURCES OF NORTHERN CALIFORNIA.

By FRANK ADAMS,
Irrigation Manager in Charge of Irrigation Investigations in California.

INTRODUCTION.

This is the first of three reports giving the more detailed results of an investigation into the irrigation resources of California made by the U. S. Department of Agriculture, under coöperative agreement with the Conservation Commission of the State of California.

The ground sought to be covered in this investigation was (1) a study of the water supply of California available for irrigation; (2) a statement of the extent, character, and location of the agricultural areas susceptible of and adapted to irrigation; (3) a statement of the present extent of irrigation in California; and (4) a general statement of the extent and location of the unused waters available for irrigation. In connection with this study it was also proposed to prepare an irrigation map of California.

For the prosecution of this investigation a fund of $10,000 was set aside by the Conservation Commission and about $4,000 was allotted by the U. S. Department of Agriculture. This small fund was obviously inadequate to make an exhaustive engineering and agricultural study of the irrigation resources of California. It was thought to be sufficient, however, by making use of available published and unpublished data, for showing with substantial accuracy such essential features regarding irrigation development and possibilities in California as are necessary to give the general public a clearer idea than they have heretofore had of the importance of enacting better irrigation laws.

The State of California covers an approximate area of one hundred million acres and occupies a north and south distance of over seven hundred miles. For these reasons and because of the diversity of conditions it is not convenient to present the results of the entire study in as much detail as is desired in a single report. This report, therefore, deals with northern California alone, which is taken to be that portion of the State north of San Francisco, San Pablo, and Suisun bays, and the southern boundaries of Sacramento and Amador counties. Further reports follow in sequence covering the irrigation resources of central and southern California. A fourth report is being prepared that summarizes the results obtained for the whole State and treats in more detail of the character of the present use of water for irrigation, in accordance with a second agreement with the Conservation Commission entered into early in 1912.

PREVIOUS INVESTIGATIONS.

California has long been a field of scientific agricultural investigation, so that the main agricultural characteristics of the State are well known. In 1880 Mr. Wm. Ham Hall, state engineer, issued as part of his first report, a report on the irrigation of the plains in which questions of both land and water were treated exhaustively in the light of physical data and knowledge of irrigation then available.[1] Annual and special reports of the California Agricultural Experiment Station have considered questions of soils, alkali, crops, waters, and culture methods from the standpoint of irrigation development. In 1883, Dr. E. W. Hilgard, until recent years director of the station, submitted to the superintendent of the census a treatise on the agricultural features of California, with an agricultural map, that outlined the various agricultural zones of the State and described both their physico-geographical and main soil features.[2] For many years the United States Geological Survey has been mapping topography, measuring streams, and studying underground waters in California, and for several years the United States Reclamation Service had engineers in the field looking for possibilities for development under the reclamation act. Since 1900 the Office of Experiment Stations, U. S. Department of Agriculture has been prosecuting irrigation investigations in California, since 1903 in coöperation with the State, and numerous bulletins giving results of these investigations have been published from time to time.[3] In addition, during 1910 and 1911, the Office of Experiment Stations took a full irrigation census of California under coöperative agreement with the Bureau of the Census, this census covering not only acreages and costs, but also the more general features of irrigation development. Thus the investigation into irrigation resources with which this and the succeeding reports deal had as a starting point a large mass of known data without which the work would not have been possible within the limits of time and money available under the agreement with the Conservation Commission.

PLAN OF FIELD WORK.

Irrigation is not equally necessary or equally advantageous all over California, nor is it possible to determine either its necessity or its advantage wholly by rainfall. If general grain farming were the highest use to which the soils of the State could be put, but little irrigation development would be found either now or in the future in the coast or interior valleys north of Sacramento or Stockton. But from these points southward, the degree of irrigation necessity would increase toward the southern boundary, becoming absolute in the lower San Joaquin and in most of the agricultural territory south of Tehachapi. If, however, it were not for the fact that, except in the mountain valleys, the California winter is a growing period, even the northern third of the State would not grow large annual crops without irrigation, because rainfall in California comes mostly from November to April, followed by the well-known California rainless summer, during which few plants could be both germinated and brought to maturity without artificial moisture. On the other hand, it is the rainless summers that make irrigation either a necessity or a marked advantage in nearly every section of the State, and which prevent disregarding any section in a state-wide irrigation survey.

---

[1] Report of the State Engineer to the Legislature of California, Session of 1880.

[2] U. S. Int. Dept., Census Office, Report on the physical and agricultural features of the State of California, by E. W. Hilgard, Ph.D., 1884.

[3] See chiefly U. S. Dept. Agr., Office Expt. Stas. Buls. 100, 119, 133, 158, 207, 236, 237, 239; Senate Doc. 246, 60th Cong., 1st Sess.

The climatic and other agricultural features of California being so variant in their effect on irrigation requirements and practices, the most practicable way of treating the irrigation resources is by what might be termed irrigation zones, within which both present irrigation practice and probable future irrigation needs are generally the same. Six such zones or divisions, following county lines where convenient and topography rather than hydrography, were accordingly assumed for northern California, as follows: The northern coastal counties, including the bay and coast counties north of San Francisco and also Lake County; the northcentral mountain valleys, including Siskiyou and Trinity counties, Shasta County north of Pit River, and the portion of eastern Lassen County that lies in Fall River Valley; the northeastern plateaus and valleys, including Modoc and Lassen counties except the part of Fall River Valley lying in Lassen County, and Mountain Meadows, west of the main range, in Lassen County; the upper Sierra or Feather River valleys, including Mountain Meadows in Lassen County and the valleys in Plumas and Sierra counties, all of which lie in the upper Feather River drainage; the Sierra foothills, below an elevation of 2,500 feet and above the plains of Sacramento Valley; and Sacramento Valley.

Platting agricultural areas—This involved a reconnaissance of each area to determine the main questions as to its location, approximate acreage, and general soil and agricultural features. In this reconnaissance only areas of importance from the standpoint of irrigation were considered; that is, only those areas lying within the general belts of available water supplies and where irrigation is needed or would prove beneficial. All valley areas were sought to be visitd, even though, as on the immediate coast, water may not now be used, or, as on the deserts, no irrigation is now practiced or immediately likely on account of an absence of a water supply. Rolling and broken mountain areas were included only as they are within range of water for irrigation, as the plateaus of Modoc and Lassen counties and the foothills of the western Sierra Nevada. Further standards were that the areas should be irrigable, cultivable, and capable of producing agricultural crops, that they should not be forested with merchantable timber and therefore at present more valuable for forests than for agriculture, and that where wooded and rolling they should at least be similar in character to nearby areas that are being cultivated and irrigated. Thus an attempt was made to consider all agricultural lands in the State that are topographically irrigable and within reasonable reach of water supply for irrigation; yet where the lands exceeded in acreage the areas for which there is water for irrigation, no endeavor was made to indicate the particular areas on which the available water is most likely to be used and which, in a very strict sense, might therefore be termed the only irrigable areas of the State. The outlines of the areas are based on careful field inspection and not on instrument surveys. In some cases, particularly of the Sierra foothills and the foothill and valley plains of Sacramento Valley, the absence of distinct differences made the choice of where the outlines should be run to some degree a matter of the personal judgment of the agent. But where doubt existed as to their proper location for important areas, careful inspection was made with a view to such revision as might be found necessary. Therefore, the agricultural areas as shown on the accompanying map are believed to be substantially correct, yet the map should in no case be considered as drawing the line between agricultural and non-agricultural land on individual holdings.

Platting irrigated areas—This was done in connection with the reconnaissance of agricultural areas but was based chiefly on the irrigation census. In case of important areas, the data were revised to 1911 and under the larger canals in Sacramento Valley to 1912, inclusive. Areas irrigated by small private ditches or small private pumping plants have been platted to the nearest section where such section is shown by the census returns or where it has been otherwise possible to locate such areas with reasonable certainty. Areas under small private systems for which the location could not be ascertained in this way have been omitted from the map but are included in the tabular summaries in this report.

Water supply—General data regarding the water sources available to the various areas have been obtained in the field in connection with the reconnaissance of those areas for determining their location, extent, and agricultural characteristics. Stream-flow data have been chiefly obtained from the records of the California State Engineering Department from 1878 to 1884[1] and from those of the United States Geological Survey for the years since then down to 1910, inclusive.[2] Occasional records have been taken from more recent gagings by the Geological Survey or by this Office in coöperation with it. For probable run-off where no records of public or private gagings have been at hand, conservative estimates have been made on a basis of rainfall, provided available data have warranted such procedure. Data regarding known storage have come mainly from the reports of the United States Reclamation Service and from the reports of water-supply investigations of the city of San Francisco. Other sources have, however, been drawn on as indicated. No opportunity has been afforded for searching out reservoir sites by field investigation. For northern California conclusions regarding underground supplies are based on data regarding irrigation wells reported to 1910, inclusive, by the irrigation census.

[2] Summarized in U. S. Geol. Survey Water Supply Papers Nos. 298 and 300.

SUMMARY OF AGRICULTURAL AND IRRIGATED AREAS.

The concluding pages of this report summarize the data that have been gathered as to the irrigation resources of northern California, but the following preliminary summary will indicate in advance the relative areas in the six different irrigation zones that have been assumed for northern California:

Summary of agricultural and irrigated areas in northern California.

Division.	Valley agricultural land. Acres.	Valley plains. Acres.	Foothill agricultural land. Acres.	Areas irrigated. Acres.
Northern coastal counties	503,000			2,290
North central mountain valleys	435,000			99,910
Northeastern plateaus and valleys	867,000			161,850
Feather River valleys	158,000			50,600
Sierra foothills			789,000	45,250
Sacramento Valley	2,659,000	790,000		123,800
Total	4,622,000	790,000	789,000	483,700

NORTHERN COASTAL COUNTIES.

The seven counties embraced within this division or zone have been generally considered as not requiring irrigation. For the extreme northern coast, as above Cape Mendocino, such is undoubtedly the case, as it is also for the remainder of the division if absolute necessity is meant, or if the crops grown are perennial and deep-rooting. But away from the coast, rainless summers are as much a fact here as elsewhere in the State, and for such crops as alfalfa and summer-growing annuals, irrigation grades from a distinct advantage to almost a necessity. The growth and yield of even orchards and vineyards when on shallow and non-retentive soil can also undoubtedly be increased by irrigation water where topography and supply permit its application. It can safely be predicted that throughout this entire division, excepting along the immediate coast, every drop of water that can be put on to land will eventually be used in irrigation.

Summary of valley agricultural and irrigated areas in northern coastal counties of Del Norte, Humboldt, Mendocino, Sonoma, Lake, Napa, and Marin.

Area.	County.	Valley agricultural land, acres.	Area irrigated, acres.	Principal water sources for irrigation.
Smith River Valley and adjacent coastal lands	Del Norte	36,000	0	Smith River; supply ample.[1]
Lower Klamath River	Del Norte	8,000	0	Klamath River; supply ample.[1]
Upper Klamath and tributaries	Humboldt	300	100	Klamath River and tributaries; supply ample.
Prairie Creek	Humboldt	700	--------	Prairie Creek; supply ample.[1]
Orick	Humboldt	1,300	--------	Redwood Creek; supply ample.[1]
Big, Stone, and Freshwater lagoons	Humboldt	1,800	--------	Lagoons south of Orick; supply ample.[1]
Hupa Valley	Humboldt	6,800	--------	Trinity River; supply ample.
Little River	Humboldt	2,400	150	Little River; supply ample.[1]
Essex	Humboldt	700	--------	Mad River; supply ample.[1]
Upper Mad River, scattering	Humboldt	1,000	--------	Mad River and tributaries; supply ample.
Mad River bottoms	Humboldt	6,200	--------	Mad River; supply ample.[1]
Arcata Bottoms	Humboldt	11,500	0	Mad River and Jacoby and Freshwater creeks; supply ample.[1]
Lower Humboldt Bay drainage	Humboldt	5,900	0	Elk River and Salmon creeks; supply ample.[1]
Kneeland Prairie	Humboldt	9,500	0	None readily accessible.
Maple Creek	Humboldt	600	0	Maple Creek; supply ample.[1]
Eel River Valley	Humboldt	42,000	0	Eel River; supply ample.[1]
Elinor	Humboldt	500	0	Eel River and small tributaries; supply ample, mainly by pumping.[1]
Pepperwood	Humboldt	800	0	Eel River and small tributaries; supply ample, mainly by pumping.[1]
Shively	Humboldt	600	--------	Eel River and small tributaries; supply ample, mainly by pumping.[1]
Englewood	Humboldt	300	--------	Eel River and small tributaries; supply ample, mainly by pumping.[1]
Myers	Humboldt	300	50	South Fork Eel River; supply ample by pumping.
Miranda	Humboldt	300	--------	South Fork Eel River; supply ample by pumping.
Phillipsville	Humboldt	300	--------	South Fork Eel River; supply ample by pumping.
Fort Seward	Humboldt	600	--------	South Fork Eel River; supply ample by pumping.
Garberville	Humboldt	1,300	--------	South Fork Eel River; supply ample by pumping.
Van Duzen River, scattering	Humboldt	2,500	25	Van Duzen River; supply ample.
Capetown	Humboldt	1,900	0	Bear River; supply ample.[1]

Summary of valley agricultural and irrigated areas in northern coastal counties of Del Norte, Humboldt, Mendocino, Sonoma, Lake, Napa, and Marin—Continued.

Area.	County.	Valley agricultural land, acres.	Area irrigated, acres.	Principal water sources for irrigation.
Petrolia	Humboldt	800	35	Mattole River and tributaries; supply ample.[1]
Upper Mattole Valley	Humboldt	4,300	0	Mattole River and tributaries; supply ample if storage is feasible.
Humboldt County, scattering	Humboldt	----------	6	
Long Valley	Mendocino	4,400	60	Long Valley Creek; supply ample if storage is feasible.
Round Valley	Mendocino	18,400	20	Middle Fork Eel River and underground; supply ample; some drainage necessary.
Williams Valley	Mendocino	1,000	0	Run-off from 11 square miles of tributary watershed.
Willits Valley	Mendocino	8,000	10	Small creeks and probably underground; supply probably ample; much drainage needed.
Walker Valley	Mendocino	1,500	60	Walker Valley Creek and springs; run-off with storage probably ample.
Potter Valley	Mendocino	7,000	100	70 square miles of watershed on East Fork of Russian River; tunnel diversion from South Eel River and pumping; supply ample.
Redwood Valley	Mendocino	4,000	10	80 square miles of watershed on West Fork of Russian River and probably underground; supply present for at least considerable area.
Coyote Valley	Mendocino	3,800	10	80 square miles of watershed on East Fork of Russian River, South Eel River, and pumping.
Ukiah Valley	Mendocino	15,000	160	250 square miles of watershed on Russian River, tunnel diversion from South Eel River, and pumping; supply ample.
Sanel Valley	Mendocino	5,000	0	Russian River by pumping.
Anderson Valley	Mendocino	5,600	25	Pumping from Navarro River and tributaries.
Garcia River Valley	Mendocino	1,800	0	Garcia River.[1]
Mendocino County, scattering	Mendocino	----------	92	
Russian River Valley	Sonoma	35,000	200	Russian River, tunnel diversion from South Eel River, and pumping; with full development supply ample for area likely to be irrigated.

Dry Creek Valley	Sonoma	8,000	20	100 square miles of watershed producing mostly torrential flow; some pumping.
Santa Rosa Valley	Sonoma	90,000	60	Santa Rosa, Mark West, and Petaluma creeks are perennial, but give small summer flow; underground water available in some cases where needed.
Knights Valley	Sonoma	2,500	13	10 square miles of local watershed.
Los Guilicos Valley	Sonoma	16,000	15	50 square miles of watershed would give partial supply if storage is available.
Sonoma Valley	Sonoma	23,000	344	80 square miles of watershed with storage required; artesian flow near Sonoma; supply inadequate for full irrigation.
Gravelly Valley	Lake	500	5	Proposed reservoir site.
Upper Lake	Lake	6,200	0	Middle Creek with 67 square miles of watershed of typical coast range topography above Clear Lake; average annual run-off is 770 acre-feet per square mile.
Bachelor Valley	Lake	1,900	0	13 square miles of local watershed.
West Lake Valley	Lake	1,100	0	Small local drainage and pumping from Clear Lake.
Scotts Valley	Lake	4,200	25	77 square miles of watershed; some artesian supply.
Big Valley	Lake	11,000	280	Kelsey Creek with 120 square miles of rough drainage yielding a large torrential run-off; reservoir reported privately surveyed with capacity of 27,500 acre-feet; supply should be ample if all conserved.
Long Valley	Lake	2,600	0	Long Valley Creek with about 40 square miles of watershed.
Little Indian Valley	Lake	1,400	24	North Fork of Cache Creek. Little Indian Valley on this stream has been considered as a reservoir site, the United States Reclamation Service estimating that 110 square miles of watershed will produce 50,000 acre-feet annually.[2]
High Valley	Lake	2,000	0	8 square miles of local watershed.
Burns Valley	Lake	900	0	Possibly minor storage and pumping from Clear Lake.
Lower Lake	Lake	1,700	31	9 square miles of local watershed and pumping from Clear Lake.
Morgan Valley	Lake	1,700	0	10 square miles of local watershed, insufficient without underground supply.

Summary of valley agricultural and irrigated areas in northern coastal counties of Del Norte, Humboldt[1]*, Mendocino, Sonoma, Lake, Napa, and Marin*—Continued.

Area.	County.	Valley agricultural land, acres.	Area irrigated, acres.	Principal water sources for irrigation.
Cobb Valley	Lake	400	50	10 square miles of local watershed on upper Kelsey Creek.
Coyote Valley	Lake	4,800	65	Putah Creek; supply ample if available; United States Reclamation Service estimates 80,000 acre-feet available for storage.[2]
Middletown	Lake	6,600	142	Putah Creek drainage; supply ample if available, although storage necessary.
Napa Valley	Napa	42,800	311	Napa River and Conn, Sarco, Milliken, Dry, and White Sulphur creeks would give all needed with storage; tributary watershed of 235 square miles with light summer flow; underground supply uncertain.
Berryessa Valley	Napa	10,000	130	550 square miles of Putah Creek drainage with storage would supply water needed if legally available.
Capell Valley	Napa	700	0	16 square miles of local watershed on Capell Creek.
Foss Valley	Napa	400	0	10 square miles of local watershed.
Wooden Valley	Napa	1,100	0	8 square miles of local storage tributary to Suisun Creek.
Gordon Valley	Napa	1,000	0	18 square miles of local watershed.
Marin County, scattering	Marin	----------	67	
Totals	--------------	503,000	2,293	

---

[1] Little irrigation likely; see text.

[2] U. S. Reclamation Service, 5th Annual Report.

As shown in the accompanying tabular summary, although numerous, none of the valley agricultural areas in this division are large compared with the principal areas elsewhere in the State. The three northern coast counties comprise an important redwood belt, and particularly in Del Norte and Humboldt, almost the sole agricultural industries are dairying and stockraising. From Russian River Valley in Mendocino County north to southern Humboldt, stockraising predominates, while in the remainder of the division, particularly about Ukiah, Cloverdale, Geyserville, Healdsburg, Santa Rosa, and Sebastopol, in Mendocino and Sonoma counties, Kelseyville, in Lake County, and throughout Napa Valley the more intensified culture associated with orchard and vineyard growing leads. Here, although some orchards on the drier land will be irrigated as the benefits of irrigation are more thoroughly appreciated, as well as farther north the main use of water will be on alfalfa, small fruits, and truck.

The water resources of this division are less utilized than are those of any other similar area in California. Due to this fact there have been less investigation and measurement of their quantity. The upper drainage of Cache and Putah creeks in Lake County has been measured for proposed use in Sacramento Valley, but except for Klamath River, in Oregon, no gaging stations have been maintained by the United States Geological Survey on any of the coast streams in this division prior to 1910.[1] It is known, however, that the flow of Smith, Klamath, Trinity, Mad, lower Eel, Mattole, and the other principal streams in Del Norte and Humboldt counties is considerably more than will ever be required in irrigation, owing to the small areas of agricultural land bordering them and lying away from the coast. As a rule, the smaller streams in these two counties will be of most importance, because most easy to put on the irrigable land, and because the crops that can be raised under irrigation generally will not yet justify the cost of lifting water from the lower beds of the large streams. No measurements are at hand for these smaller streams, but in most cases their flow is ample for the small areas within their reach. In Mendocino, Sonoma, Lake, and Napa counties, the water supply is less abundant and the areas of agricultural land larger. There the most important streams from an irrigation standpoint are Russian River, reinforced by tunnel diversion from South Eel River north of Potter Valley, Kelsey Creek, and Napa River. Proposed increased diversion from South Eel River into Russian River will if carried out have an important bearing on irrigation development in Russian River Valley and nearby areas. Involved with this is the proposed storage in Gravelly Valley, Lake County, of 200,000 acre-feet of water, Gravelly Valley reservoir site having a tributary watershed of 240 square miles. The generation of power in connection with the diversion from South Eel River is part of the development under way, and as the use of the water in Russian River, Potter, and neighboring valleys will be largely by pumping, the power features can be made an important adjunct.

---

[1] In the fall of 1910 or the fall of 1911 gaging stations were established by the Geological Survey in this division as follows: Middle, North, and South forks Smith River, near Crescent City; Redwood Creek, near Korbel and near Orick; Mad River, near Arcata; Eel River, near Scotia; Van Duzen River, near Bridgeville; Yager Creek, near Carlotta; South Fork Eel River, near Garberville; Middle Fork Eel River, near Covelo; South Eel River, near Hearst; Russian River and East Fork, near Ukiah; Russian River, near Geyserville.

In Napa County, irrigation conditions are somewhat similar to those in Russian River Valley, although rainfall on the agricultural portions is somewhat less and the expense of supplying irrigation water greater. The successful growth of crops without water here as elsewhere in this division has diverted attention from the benefits of irrigation.

The main irrigable valley in Lake County is Big Valley, south of Lakeport. Storage on Kelsey Creek and the possible pumping from Clear Lake, if legally feasible, for the lands lying close to Clear Lake, must furnish the water supply. Cache Creek, which is the outlet of Clear Lake, and Putah Creek, which also rises in Lake County, are or will be utilized in Sacramento Valley and are therefore not part of the irrigation supply of this division.

There are few present uses of water in the northern coastal counties division adverse to irrigation, chiefly because but little use of the coast streams has yet been made. Due to lack of local development furnishing a market for power, the more available streams of the Sierra Nevada have rather been drawn on to supply the general market.

There is a total of 503,000 acres of valley agricultural land reported in this division, of which but 2,293 acres is now irrigated. Only the run off from Lake County can be used after leaving this division. Taken as a whole, the division, which has a total area of 12,700 square miles, and a normal precipitation of 25 to 90 inches, receives far more water than can ever be utilized. Eliminating Del Norte County and the immediate coast areas of Humboldt, Mendocino, Sonoma, and Marin counties, the area of irrigable agricultural land is substantially 380,000 acres. Probably not over 100,000 acres will ever be watered.

NORTH CENTRAL MOUNTAIN VALLEYS.

That portion of California between the northern end of Sacramento Valley and the Oregon line, and extending from the lava plateaus of Modoc and Lassen counties on the east to the coast counties of Humboldt and Del Norte on the west, comprise what is conveniently classified as the north central mountainous division of the State. Within this division are the counties of Siskiyou and Trinity, Shasta County above the junction of the Sacramento with the Pit, and a small portion of Lassen County included in Fall River Valley about Pittville. The northern half of the division, comprising Siskiyou County, and extending from Mt. Shasta and the Scott and Trinity mountains to Oregon, is within the Klamath drainage. Trinity County is almost wholly within the drainage of Trinity River, which in turn empties into the Klamath in northern Humboldt.

Speaking generally, this diviison is an intermountain region of relatively backward irrigation development. While scattered over four counties, the agricultural areas are mainly similar in conditions; they range in elevation from 2,000 to 4,000 feet, generally have a rainfall of less than 20 inches, are surrounded by forest or mining interests, and are devoted mainly to crops associated with stock-raising. The valleys, although already generally prosperous, are capable of a considerable advancement, but this must be conditional on a more modern irrigation system and less wasteful irrigation practice. While the need for irrigation is generally recognized and most of the water in immediate proximity to the irrigable land is claimed and supposedly put to use, yet that use is far less economical than would be required under a public irrigation policy that would look to the most complete utilization possible.

SUMMARY OF VALLEY AGRICULTURAL AND IRRIGATED AREAS.

The following tabular summary groups the northcentral mountain valleys by counties and gives the acreages of valley agricultural and irrigated land in each:

Summary of valley agricultural and irrigated areas in north central mountain valleys.

Area.	County or counties.	Valley agricultural land. Acres.	Areas irrigated. Acres.
Lower Klamath Lake	Siskiyou	23,000	4,600
Butte Valley	Siskiyou	65,000	2,800
Klamath River above Salmon River	Siskiyou	23,000	8,900
Shasta Valley	Siskiyou	158,000	23,800
Scott Valley	Siskiyou	55,500	15,500
Fall River Valley	Shasta and Lassen	66,000	24,700
Salmon River and tributaries	Siskiyou	600	600
Red Rock Valley	Siskiyou	11,000	0
Grass Lake	Siskiyou	4,400	0
Sisson Valley	Siskiyou	2,200	1,400
Burney and Goose valleys	Shasta	6,000	5,000
Cayton Valley	Shasta	1,700	1,300
Hat Creek	Shasta	4,500	3,000
Hay Fork and scattering	Trinity	8,000	6,355
Pit River and tributaries from McCloud River to Burney Creek	Shasta	1,700	1,700
Sacramento River above Pit River	Shasta	500	328
McCloud River, scattering	Shasta	900	900
Scattering		3,000	2,967
Totals		435,000	103,850

The most northerly agricultural areas in this division are those around Lower Klamath Lake, in Butte Valley, and along Klamath River and its small tributaries down as far as Salmon River.

LOWER KLAMATH LAKE DISTRICT.

This lies at a mean elevation of 4,200 feet along the Klamath Falls branch of the Southern Pacific Railroad near Dorris. Exclusive of uncropped marshes immediately bordering or forming part of Lower Klamath Lake, the agricultural area approximates 23,000 acres, of which 4,600 acres, chiefly in meadow, are reported irrigated, this acreage not including sub-irrigated marsh lands. The land in the district is mostly held in a few large stock ranches, with several small ranches along Sleepy Creek and on the better drained marsh lands. The normal annual precipitation is estimated as 15 inches. The principal water sources for irrigation are Willow and Cottonwood creeks, the former carrying 9.6 cubic feet per second at low stage in 1909; and gagings on the latter in the same year varying from 15.3 to 20.1 cubic feet per second.[1] Underground supplies are probably available along Lower Klamath Lake if pumping them becomes justified. Present irrigation is entirely by means of private ditches, use being wasteful. Twenty-seven thousand acres of Lower Klamath Lake marsh lands was originally included in the Klamath project of the United States Reclamation Service and for several years experiments have been conducted to determine the agricultural value of these lands. A preliminary report of these experiments[2] shows these lands to lack essential elements of fertility, to contain a sufficient quantity of black alkali, which can not be leached out by known methods, to render them unfit for crop production, and to possess such conditions of air drainage that low temperatures and killing frosts are likely to occur every month of the year.

BUTTE VALLEY.

With 65,000 acres of agricultural land and 2,800 acres of it reported irrigated, Butte Valley lies northeast from Shasta Valley on the Klamath Falls branch of the Southern Pacific Railroad, at an elevation of 4,200 feet. Only a relatively small portion of the valley is under cultivation. The soil is sandy in the southern and eastern parts and heavier in the vicinity of Butte Lake and in the valley floor north of Macdoel. Until recent years the valley has been used entirely for stock purposes, but subdivision into smaller holdings has been undertaken but not yet with marked result. The tributary watershed of 530 square miles is a combination of lava and desert hills and much of it is relatively flat, near the valley being sparsely covered with juniper and other scrub growth, with pine and fir timber on the higher of the mountains and in the valley at the southern end. The present chief water sources for irrigation are Praether and Butte creeks, both of which are small and sink before reaching the lake. While much of the soil of the valley is well adapted to agricultural growth, liability to summer frosts limits the crops that can be grown and the possible range of production is not yet worked out, although it is certain to be made up of the hardier strains of grains and forage and of such other crops as will stand low temperatures during the growing season. Some slight increase in the irrigated area will come from the better use of the small streams entering from the south, but if any extensive area is irrigated it would appear that the water supply must come from underground sources, which are as yet not understood. The ground water through the valley generally stands from 4 to 10 feet below the surface, but wherever water has been found underground sufficient for purposes of irrigation it has come from wells that tap the gravel strata between strata of blue clay of varying thickness and lying at depths of 100 feet, more or less. Attempts to obtain artesian supply have not thus far been successful. A considerable area in the trough of the valley is covered by an alkaline marsh, known as Butte Lake, and land immediately adjacent thereto is of little agricultural value.

[2] U. S. Dept. Agr., Bureau Plant Industry Circ. 88.

KLAMATH RIVER AREAS.

West of the Klamath Lake district and also mostly immediately south of the Oregon line lie the scattered areas along Klamath River and smaller tributaries, the largest and most accessible and therefore the most important being near the Southern Pacific Railroad in the general neighborhood of Hornbrook. The elevation of these areas from the mouth of Salmon River, in southeastern Siskiyou County, to the Oregon line varies from 1,800 to 3,000 feet. Above the mouth of Shasta River the aggregate of the areas approximates 20,000 acres, of which 5,500 acres are irrigated, distributed as follows: Klamath River, 2,800 acres; Little Bogus Creek, 100 acres; Big Bogus Creek, 1,100 acres; Camp Creek, 60 acres. There is always likely to be water enough in Klamath River for pumping to the small areas, but pumping is not feasible in all cases. For the tributary creeks no gagings are available, but assuming the rate of run-off per square mile as on Klamath River above Keno, for which gagings are available,[1] sufficient, or more than sufficient, water is available, with storage, to irrigate all available land except on Little Bogus Creek. At present, one small coöperative ditch irrigates about 500 acres near Hornbrook; land along the tributary creeks is irrigated by small private ditches, and along Klamath River mainly by current wheels. The present low-water flow of the creeks is mostly utilized and further irrigation development on them must come through storage, by pumping from underflow, if found feasible, or from Klamath River, or by gravity diversion from the upper Klamath to lands along Bogus and Willow creeks. Below the mouth of Shasta River the aggregate agricultural area is only 3,100 acres, lying in pockets of 10 to 300 acres along Klamath River and Humbug, Parkhouse, Daggett, Beaver, Seiad, Indian, Camp, Horse, and McKinny creeks, with all of it irrigated. Owing to the lack of additional valley land here and the remoteness of the areas from lines of travel, little if any additional development under irrigation can be looked for below the Shasta.

---

[1] U. S. Geol. Survey, Water Supply Paper No. 300.

At present the most important valleys in this division are Shasta Valley, Scott Valley, and Fall River Valley.

SHASTA VALLEY.

Including the local valleys about Yreka and Little Shasta, Shasta Valley comprises an area of 158,000 acres of agricultural land lying along the San Francisco-Portland branch of the Southern Pacific Railroad a few miles south of the Oregon line. The mean elevation of the valley is approximately 2,650 feet and the principal towns are Yreka, Montague, Little Shasta, Gazelle, and Edgewood. The valley floor is considerably broken by buttes, one line cutting off Yreka on the west, another cutting off Little Shasta Valley on the east, and an indefinite number lying scattered south of Little Shasta. Southeast of Little Shasta junipers and lava cover approximately 80 square miles of the valley floor and of this less than one half is roughly estimated as cultivable. A further break occurs east of Gazelle, where a considerable area is swamp. Otherwise than as above, however, the valley floor is comparatively flat and of good agricultural value, and all growing cultivated or native crops. The present irrigation water supply of the valley comes from numerous sources which unite to form Shasta and Little Shasta rivers. The most important of these sources are living springs of almost constant flow, the largest of which, known as Big Spring, discharging a minimum approximating 125 cubic feet per second, with all of them together discharging approximately 150 cubic feet per second. The main Shasta heads in three branches in the Eddy Mountains near Edgewood, and is joined in the upper portion of the valley by Boles, Beaugham, Jackson, Carrick, Willow, Julian, and Yuba creeks, none of these supplying large summer flow, and nearly all of what they do supply being diverted for irrigation prior to reaching Shasta River. Big Spring enters Shasta River below these tributaries, and furnishes practically the entire flow during the late summer. Little Spring, 2 miles west, discharging 8 to 9 cubic feet per second, would also enter Shasta River in the same vicinity were it not all diverted into three ditches for irrigation. Little Shasta River, which, with the springs feeding or adjacent to it, furnishes the main additional water supply of the valley, enters the main Shasta a short distance south of Montague. The springs of Little Shasta Valley are more numerous than along the main Shasta, the largest being Cleland Spring, with a constant flow of about 13 cubic feet per second. Others are Bassey Branch and Martin Springs, each with approximate discharge of 3.5 cubic feet per second. Isolated gagings only are available for Shasta River, the largest measured flow having been made four miles northeast of Yreka on June 26, 1907, when an hydrographer of the United States Geological Survey found 250 cubic feet per second.[1] Gagings made by the Irrigation investigations in 1911 for the Geological Survey one mile south of Montague showed 101.91 cubic feet per second. at probable low water, on August 24, and 157.35 cubic feet per second, on October 25. No gagings for Little Shasta River are available other than one made by the Irrigation Investigations August 21, 1911, when the flow was 7.24 cubic feet per second 1.5 miles northeast of Little Shasta post office, this being considered by local residents as slightly above the minimum flow. Of the flow of the other tributaries of Shasta River nothing is known other than that it is wholly used in irrigation during the low-water months and that considerable volumes of water are carried at other seasons. No reservoir sites tributary to Shasta Valley are known to have been surveyed. Power development near the mouth of Shasta River controls part of the flow, but conservative estimates of possible run-off from the tributary drainage indicate that, if stored, water is at hand for the irrigation of a considerably larger area than now receives water. Underground water is available in some parts of the valley, particularly in the vicinity of Big Spring, where some pumping development already exists, and probably also along the bed of Shasta River. In both Shasta and Little Shasta valleys, considerable areas are in urgent need of drainage. The water supply most generally counted on for increasing the irrigated areas in Shasta and Little Shasta valleys is Klamath River, to be diverted above Shovel Creek in general accordance with reconnaissance surveys of the Reclamation Service in 1904–5. By these surveys 65,600 acres was found to be irrigable from Klamath River and 5,000 acres irrigable from Little Shasta River and adjacent springs.[1]

---

[1] U. S. Geol. Survey, Water Supply Paper No. 251.

Owing to the fact that land holdings in Shasta Valley are large, future irrigation development will largely depend on comparatively few interests. At present irrigation is mainly confined to meadows and alfalfa. With the exception of one small coöperative ditch in Little Shasta Valley, watering 1,550 acres, and Yreka ditch near Gazelle and Edgewood, which although privately owned waters a number of farms in satisfaction of old rights, irrigation in Shasta Valley is accomplished by a large number of small private ditches.

Owing to uncertainty as to possibilities of storage tributary to Shasta Valley or as to the final feasibility of bringing water from the Klamath, it is difficult to estimate the ultimate irrigation possibilities of the area. There seems little doubt, however, that the present irrigated area can eventually be nearly trebled, the underground sources and possible stoppage of present waste together probably being sufficient for doubling the acreage now watered.

---

[1] U. S. Reclamation Service, Fourth Annual Report.

SCOTT VALLEY.

Next to Shasta Valley, this is the most important agricultural section in Siskiyou County. It lies between mountains 4,000 to 8,000 feet high, with a mean elevation approximately the same as that of Shasta Valley, and a total area of 55,500 acres. The agricultural land consists principally of bottom land adjacent to Scott River and bottom land lying in narrow strips along the streams tributary to it. Excluding swamps, all of the valley floor is irrigable, with 16,300 acres now irrigated. The latter area is largely watered by the creeks entering the valley from the south and west, rather than by the main Scott River.

Although 20 miles from the nearest railroad, Scott Valley has reached a considerable development. While tributary mines, especially along Salmon River, are of industrial importance to the valley, it is itself devoted mainly to dairying and stock raising, with grain growing on the higher dry lands. Because of its isolated position the valley is very largely self-sustaining agriculturally and therefore generally prosperous. Irrigation enterprise consists in one coöperative system—Farmers Ditch Company—and numerous private ditches. In addition, one or two pumping plants have recently been installed to water some of the land on the east side of the valley, with others contemplated. The ditches from the west-side creeks are mostly short and cover land riparian to and on both sides of the creeks at their entrance to the valley. Including 2,700 acres of swamp land in the trough of the valley, there are some 8,500 acres that need drainage and to cover which a levee and drainage district has been proposed, but not yet organized. Land holdings in the valley average over 250 acres, with many over 400 acres. The use of irrigation water is as a rule extravagant. Under Farmers Ditch the assumed duty is 1.5 inches per acre, or about 1 cubic foot per second to 33 acres. As in other stock-raising and dairying sections of northern California, the crops grown are meadow hay, alfalfa, and grain, the latter very largely oats. At one time a number of orchards were planted in the valley. Now, however, practically no fruit is grown commercially.

The water supply of Scott Valley is limited chiefly to Scott River and the tributaries entering from the south and west, the upper watersheds of which are high and snow-covered in winter. Very little water comes from the east-side range. Of the 711 square miles of drainage tributary to the valley, 243 square miles forms the area above and including that of Clark Creek. No measured rainfall or stream data are available, but the rainfall is sufficient and the drainage of such a character to indicate clearly that there is ample water at hand in the course of the year's flow to irrigate the entire valley if it could be conserved. At present the low-water flow is all utilized.

FALL RIVER VALLEY.

Although the most isolated of the larger northcentral mountain valleys, this is one of the most important of the agricultural areas in this division and second only to Shasta Valley. It is located along Pit and Fall rivers at an elevation of 3,400 feet in northeastern Shasta County, with approximately 10,000 acres along Pit River in western Lassen County that is properly classed with it. Being 85 miles distant by wagon road from Redding and 20 miles from the nearest railroad, at Bartle, the valley lies so far away from usual paths of travel that its exceptional irrigation resources are far less developed than customary even in the northern mountain areas. The area of the valley is taken as 66,000 acres, of which 24,700 acres is reported irrigated. Of the latter, about 17,500 acres are in one holding, whose irrigation has been accomplished by reclamation of Tule Lake and the utilization of water drained from the adjacent swamp, with the remainder chiefly immediately along Pit River about Pittville, McArthur, and Fall River Mills. The irrigated crops are clover, timothy, and alfalfa. Much of the valley, however, is devoted to dry grain farming, but this having been practiced for many years and the normal rainfall approximating only about 20 inches, it is not now generally profitable. The local water supply is relatively the largest during the irrigation season of any important area in northern California, Fall River originating in the valley in two springs whose measured discharge at Fall River Mills was found to be 1,510 cubic feet per second in September, 1903, when supposedly constant.[1] In addition, Pit River passes through the southern portion of the valley and with storage above, if that were necessary, could be made to furnish an irrigation supply here, and Beaver Creek, with a small supply, enters the Pit near Pittville. There can be no question therefore of the availability of a water supply for the entire valley and that it can all be classed as irrigable. Power development will eventually complicate the use of water for irrigation, but although this is projected and filings have been made for it on Fall River, utilization has not yet been effected. Further irrigation development will be by pumping as well as by gravity, Fall River being so situated with reference to the adjacent irrigable lands as to make pumping both economical and desirable and to assure its employment on a considerable scale when hydroelectric power is at hand.

SALMON RIVER AND TRIBUTARIES.

An area of 574 acres of irrigated land, which probably includes all of the agricultural land, is reported along Salmon River and its forks and Black Bear, Taylor, and Crawford creeks, in Siskiyou County. This land is similar to that along the main Klamath. The Salmon River section being a mining district, like the lower Klamath section, the small areas that can be farmed are, because of their scarcity, of considerable local value, but still of little general importance. Communication with this district from the east is usually by way of Etna Mills.

---

[1] U. S. Geol. Survey, Water Supply and Irrigation Paper No. 134.

RED ROCK VALLEY.

This is a flat to rolling valley 4,400 feet high lying 12 miles east of Butte Valley and covering an area of about 11,000 acres. The precipitation here is probably about the same as that in Butte Valley. Although the soil seems well suited for agriculture, information at hand discloses no water available for its irrigation. No streams enter the valley, and the only known possible source of water will be wells, of which none have been found sunk for irrigation purposes.

GRASS LAKE.

This valley is 10 miles east of Shasta Valley and comprises a swamp area of 4,400 acres lying at an elevation of 5,100 feet. It is entirely devoted to wild native grass and no land is irrigated. The only water supply available is from springs and underground sources. The valley is of no agricultural consequence without drainage. By draining this area, water could probably be developed for lower lands, of which there are about 520 acres in the neighborhood of Sheep Rock, now farmed dry.

SISSON VALLEY.

This is a small mountain valley situated about Sisson, directly under Mt. Shasta at an elevation of 3,400 feet, of which 2,200 acres are cleared, with an indefinite additional area that may later be cleared and irrigated. The chief crops grown are meadow hay, vegetables, and hardy fruits, the meadow hay the main irrigated crop, the irrigated acreage of which is 1,400 acres. The normal annual precipitation here being nearly 40 inches, little irrigation is needed for cultivated crops. Springs and artesian flow are of frequent occurrence, Big Spring, at the north end of the valley, furnishing the main supply to the numerous small ditches present. At present most of the good land is under cultivation. Local capital is concerned in a proposed project for clearing more of the land now wooded and irrigating it from the upper Sacramento.

BURNEY AND GOOSE VALLEYS.

These lie tributary to Pit River southwest of Fall River Valley. Of an aggregate of 6,000 acres of land in them, 5,000 acres in timothy, clover, and alfalfa are irrigated. With more economical use the tributary drainage of 136 square miles would supply sufficient run-off for irrigating all of the land. The used water supply comes from Goose and Burney creeks. The water sinks about 4 miles below Burney Creek and does not rise again until it has passed below the agricultural land. Goose Valley was formerly a swamp and known as Goose Lake, but it has been reclaimed both by intercepting the inflow and by drainage. Except in the Goose Lake area, irrigation methods are reported crude.

CAYTON VALLEY.

This small area of 1,700 acres, of which 1,300 acres are irrigated, lies west of Fall River Valley, along Cayton and Clark creeks, at an elevation of 3,600 feet. The drainage area consists of 15 square miles of steep lava hills and the two small creeks should furnish enough additional water for the small unirrigated area.

HAT CREEK AREA.

This consists of approximately 4,500 acres of valley land scattered in pockets for 25 miles along Hat Creek, a tributary of the Pit 10 miles below Fall River. The elevation of the agricultural lands varies from 3,000 to 4,000 feet and the irrigated area is reported as 3,000 acres. The tributary drainage area is 425 square miles and the run-off from this is sufficient to irrigate all of the agricultural land present, although no discharge gagings are available to indicate the character of the stream flow. When the section was visited litigation was under way that sought to establish the right of a power company to divert Hat Creek into Cow Creek for power purposes. Owing to the small size of the scattered areas here, but little irrigation increase is to be expected.

SACRAMENTO RIVER NORTH OF PIT RIVER.

Physical conditions along Sacramento River north of the Pit make irrigation of little importance. The irrigation census of 1909 reported only 328 acres irrigated here, and the absence of much additional agricultural land will prevent any increase of consequence. The land now watered is in pockets of 5 to 20 acres each lying along the creeks in the hills.

TRINITY COUNTY AREAS.

Trinity County is almost wholly mountainous, with only 8,000 acres the approximate aggregate area of valley agricultural land. The largest agricultural areas are on Hay Fork of Trinity River, the others being scattered along the main Trinity and East and Stewart's forks, and Weaver Creek. The irrigated holdings are all small and irrigation practice is more or less primitive, consisting mainly of the flooding of small mountain meadows and gardens. Of 178 irrigators reported in the irrigation census of 1909, only 10 watered holdings of over 100 acres. The total irrigated area reported in the county was 6,355 acres, and as the total area of agricultural land is but little in excess of that, but little increase is possible. There is much land in the county at present timbered that may some time become agricultural and therefore irrigated, but this is not considered likely for some years. It is significant that in the irrigation census of 1909 the irrigators reported the present irrigated area as constituting in the aggregate 67 per cent of the area they ultimately expected to water.

PIT RIVER BETWEEN BURNEY CREEK AND McCLOUD RIVER.

Approximately 1,700 acres of irrigated land was found scattered in small pockets of meadows and gardens along Pit River and Rock, Nelson, Kosk, Hatchet, Montgomery, and Squaw creeks. While an additional area may ultimately be irrigated it will first need clearing and this is not likely to be undertaken at present. For the land now watered, the supply is sufficient except for summer scarcity on some of the creeks.

SUMMARY.

Recapitulating the data given above as to the irrigation resources of the northcentral mountain valleys, it is found that approximately 435,000 acres are valley agricultural land with approximately 104,000 acres of this now irrigated. Lack of stream gagings prevents a satisfactory estimate of the total quantity of water available for irrigation but this can be approximated for the purposes of this report on the basis of the acreage now irrigated and that which it is estimated can be irrigated in the future. If present wasteful use were to continue, there would be little opportunity outside of Fall River Valley and along the Klamath for increasing the irrigated area from supplies now immediately at hand. But as irrigators better understand the injury resulting from too much water, as they substitute for meadows alfalfa and other crops normally requiring less water than meadows, and as some way is worked out by the State that will facilitate the use of the water that is not now used at all, the present irrigated area should be nearly doubled without much storage or without carrying supplies from relatively distant sources, as from Klamath River to Shasta Valley. Assuming a duty of 1.5 acre-feet per acre per year, and also that some storage and some long-distance conveyance will be found feasible and be carried out, it is believed that the present irrigated area will eventually be increased to from 225,000 to 250,000 acres, or to more than one half of the total area of valley agricultural land found. Using the larger of the two limits and the annual duty of 1.5 acre-feet per acre assumed as eventually practicable would require 375,000 acre-feet of water annually. After analyzing the data that have been collected, there can be little doubt that such a quantity is economically available to the valley agricultural lands of this irrigation division of California.

NORTHEASTERN PLATEAUS AND VALLEYS.

The larger part of this division or irrigation zone lies in the Great Basin drainage and is all within Modoc and Lassen counties. It mostly ranges in elevation from 4,000 to 5,000 feet, with normal average rainfall on the agricultural areas usually ranging between 14 and 22 inches. Chiefly lying east of the main crest of the Sierra Nevadas, its agricultural characteristics more resemble those of northwestern Nevada than those of interior California. Although such hardy fruits as apples are successfully grown in the more favored valleys where marketing conditions warrant, the climatic conditions of a high intermountain country make the agriculture essentially characteristic of the live stock industry. Irrigation is, therefore, largely that of the meadow or the alfalfa field.

Of a total land surface of 5,662,080 acres, the tabular summary shows 867,000 acres of plateau or valley agricultural land topographically irrigable, with 161,930 acres irrigated. Portions of Modoc and Lassen counties have long been prosperous agricultural communities, but recent transportation improvements have started a considerable increased development.

SUMMARY OF VALLEY AGRICULTURAL AND IRRIGATED AREAS.

The following table gives the valley agricultural and irrigated areas in the northeastern divisions of the State:

Summary of valley agricultural and irrigated areas in northeastern lava plateau region, comprising Modoc and Lassen counties.

Area.	County or counties.	Agricultural land. Acres.	Areas irrigated, Acres.
Surprise Valley	Modoc	113,000	35,200
Goose Lake Valley	Modoc	39,000	5,800
Fandango Creek	Modoc	1,300	200
North Fork Pit River	Modoc	2,300	2,300
Alturas and South Fork Pit River	Modoc	40,000	18,600
Rattlesnake Creek	Modoc	8,000	0
Lost River drainage	Modoc	47,000	2,900
Fairchild Meadow and Antelope Plains	Modoc	25,000	1,300
Ingalls Valley	Modoc	700	0
Warm Spring Valley	Modoc	32,000	2,050
Black Canyon	Modoc	1,200	500
Stone Coal Valley	Modoc	1,000	500
Round Valley	Modoc	6,000	1,200
Big Valley	Modoc and Lassen	83,000	14,500
Ash Creek Valley	Lassen	6,500	4,000
West Valley	Modoc and Lassen	1,200	1,200
Jess Valley	Modoc	4,500	3,400
Little Valley	Modoc and Lassen	900	900
Dixie Valley	Modoc and Lassen	2,900	1,200
Madeline Plains	Lassen	153,000	3,900
Dry Valley	Lassen	3,000	0
Grasshopper Valley	Lassen	6,300	1,900
Painters Flat	Lassen	2,000	0
Snake and Rush creeks	Lassen	4,700	600
Secret Valley	Lassen	19,000	1,280
Bull Creek	Lassen	2,700	0
Horse Lake	Lassen	5,400	2,600
Eagle Lake	Lassen	1,700	200
Willow Creek	Lassen	13,900	7,100
Susan River	Lassen	66,000	22,300
Honey Lake Valley	Lassen	154,000	12,200
Long Valley	Lassen	9,300	4,100
Scattering, unlocated		10,500	10,000
Totals		867,000	161,930

Beginning with the north, the largest or agriculturally most important areas are Surprise Valley, Goose Lake Valley, Alturas, Warm Springs Valley, Big Valley, Madeline Plains, and Honey Lake Valley.

SURPRISE VALLEY.

Surprise Valley, lying in the extreme northeastern corner of California at an elevation of 4,800 feet, although 25 miles from railroad transportation, is a well settled community under relatively high irrigation development. While irrigation is thus far entirely by small private ditches, with spring use more or less wasteful, the necessity for water, its general scarcity, and its consequent high crop-producing value, have compelled better use than in most other parts of the division. About 60 per cent. of the grain raised is irrigated, as is the alfalfa not cut for seed, and the family orchards and gardens, only the two latter receiving much water in the summer. The irrigation water supply of Surprise Valley is limited to a number of short, small streams flowing from the steep eastern slopes of Warner Mountains, some artesian flow in the valley floor and such run-off as can be collected into Cowhead Lake Reservoir from 170 square miles of mostly untimbered, sagebrush watershed in California and Nevada.[1] Aside from fuller spring use of the small creeks from Warner Mountains, such individual local storage from them as is found feasible, and the possible increased use of artesian flow, the proposed development of Cowhead Lake for irrigating lands on the east side of the valley furnishes the only opportunity for watering the 77,800 acres in the valley still unirrigated.

GOOSE LAKE VALLEY.

Goose Lake Valley, with a mean elevation of 4,900 feet, lies partly in Oregon but contains 39,000 acres of fine valley agricultural land in California, with 5,800 acres now irrigated. This land immediately joins Goose Lake and because of its topography and proximity to the lake is favorably located agriculturally. Present irrigation is by small private ditches from seven small creeks flowing from Warner Mountains, and having estimated low-flow discharges of 2 to 3 cubic feet per second each. With better use of the supply from these creeks and storage where feasible, as it might be made on Fandango Creek, where a known site would furnish water for at least 2,000 acres, considerably more land in this valley might be irrigated by gravity than receives water now. A questionable source of supply is Goose Lake, by pumping. One analysis of the water of the lake made by Prof. G. E. Colby of the University of California indicates the presence of considerable quantities of injurious alkali.

FANDANGO CREEK AREA.

This small area is along Fandango Creek, a tributary of Goose Lake on its east side. The elevation of the area is 5,100 feet and the drainage area 17 square miles. At present 200 acres are in hay crops irrigated. It would seem as if the chief worth of the area would be for storage as its agricultural value is not high.

---

[1] The normal rainfall at Fort Bidwell is 20.13 inches.

ALTURAS AREA.

The uplands about Alturas differ from Surprise and Goose Lake valleys in that they form no definite or continuous valley areas, the irrigable and irrigated lands not being confined to bottoms. The economic limits of the irrigable lands are therefore difficult to determine with exactness in the absence of definite high-line surveys or of exact knowledge as to the ultimate assembling of the water supplies. North of Alturas, along North Fork of Pit River, all of the readily available land, amounting to about 2,300 acres, is now irrigated. A small area is also irrigated on Parker Creek, which enters the Pit above Alturas. Both the largest irrigable and the largest irrigated areas tributary to Alturas, however, extend along South Fork of Pit River some 20 miles south of the town, although both northwest and southwest of Auturas are sagebrush benches of considerable size that will eventually be watered. Of 40,000 acres of irrigable land about Alturas, 13,000 acres are in a single holding along South Fork of the Pit, this area having been reclaimed from a swamp condition by two drainage canals 30 and 12 miles long, respectively, the former also serving to supply irrigation water when and where needed. Including the flooded meadows, 18,600 acres were reported irrigated about Alturas in 1911.

RATTLESNAKE CREEK AREA.

This is an undeveloped area of roughly 8,000 acres lying at an elevation of 5,000 feet 8 miles north of Alturas. A flat tributary drainage area of about 50 square miles would supply some water for irrigation here if storage were available, but none is known. The drainage is of low water-yield, however, and the area itself is agriculturally not important. Any water supply that would be yielded would be light and variable.

LOST RIVER DRAINAGE.

Extending north from Pit River to the Oregon line and lying between Tule and Goose lakes is an uneven plateau country that forms Lost River drainage and lies at elevations varying from 4,000 to 5,000 feet high. In all there is roughly estimated to be 47,000 acres of agricultural land. Of this 700 acres of bottom land along Willow Creek, 1,500 acres in Steele swamp, and 700 acres in Boles Meadow, a total of 2,900 acres, are crudely irrigated. The water supplies tributary to the area are mainly Lost River and tributaries, including North Fork, South Fork, and Fletcher, Beaver, Bottle, and Rock creeks. The United States Reclamation Service has built a dam below Clear Lake in connection with their Klamath project which will store the water heretofore draining to Lost River. The original plan of the Reclamation Service was to irrigate 35,000 acres in California along the east side of Tule Lake by the use of Clear Lake storage, but owing to excessive cost this portion of the project has been deferred. Their plans also involve the reclamation of 27,000 acres of Tule Lake, by evaporation and stopping of the inflow through Lost River.

FAIRCHILD MEADOW AND ANTELOPE PLAINS.

Another high plateau section, with, roughly, 25,000 acres of agricultural land, lies 15 miles northwest of Alturas, comprising Fairchild Meadows and Antelope Plains. The elevation here is 5,000 feet. Fairchild Meadows is now a swamp and its drainage has been considered in connection with the irrigation of Boles Meadows on the north. The irrigation of Antelope Plains by the storage of torrential flow has also been considered. The drainage area of these two areas combined is of indefinite bounds but of about 150 to 200 square miles. The run-off yield is considered independable and development of consequence is said to be unlikely. Counting wild flooding, 1,300 acres are reported as now irrigated.

INGALLS VALLEY.

This is a small undeveloped area northeast of Alturas of the same character as Fairchild Meadow and of approximately equal high elevation. The only available water supply is also small, torrential, and unreliable. No land is now irrigated.

WARM SPRING VALLEY.

Warm Spring Valley, lying next below Alturas along the Pit, has a total area of approximately 32,000 acres, exclusive of the higher benches into which a portion of the valley merges. The area reported irrigated in 1911 was 2,050 acres, not including naturally flooded meadows. Aside from the use made of Pit River, irrigation water for land in this valley is obtained from Canyon Creek and from several small reservoirs, each of which supplies several hundred acres. No irrigation companies operate here. The total drainage tributary to this valley at its outlet is 1,560 square miles.

ROUND VALLEY.

Southwest from Warm Spring Valley, Round Valley lies on Ash and Rush creeks, both tributary to the Pit. Of 6,000 acres of irrigable valley land, 1,200 acres are now irrigated. The valley has a total drainage above Adin of 260 square miles. Stream-flow records maintained on Ash Creek during parts of 1904 and 1905 by the Geological Survey[1] showed a mean annual run-off of 98,500 acre-feet. A considerably smaller supply, with storage above feasible, of which some could be provided in Ash Creek Valley, would suffice for the complete supplemental irrigation of this valley, were the water available to be utilized at this place instead of, possibly, in Sacramento Valley.

---

[1] U. S. Geol. Survey, Water Supply Papers 134, 177, 213, 251.

BIG VALLEY.

Big Valley, selected by the Reclamation Service as the best reservoir site on any of the Sacramento River tributaries, is situated but a few miles below Round Valley, Ash Creek entering the Pit within this area. The total area in the valley is 83,000 acres, of which 14,500 acres, including flooding from sloughs, was irrigated in 1911. The available water sources for irrigating this valley are Pit River, Ash Creek, and Willow Creek. Gagings at Pit River at the proposed dam site at the mouth of the canyon leading from Big Valley, which is below Ash and Willow creeks, showed a mean annual run-off from 1904 to 1908 of 733,000 acre feet.[1] Much of the valley is now swamp and needs drainage before irrigation, but if full agricultural development were attempted, the water supply available from Pit River at Canby and from Ash Creek at Adin give the best basis for estimates. The stream-flow figures for the former for a period 1904 and 1905 show a mean annual flow of 424,000 acre-feet and for the latter for the same period a mean flow of 98,500 acre-feet. With storage in one or more of the upper valleys, such as Round Valley or Warm Spring Valley, which is not likely for use in Big Valley, complete irrigation development of this area would be possible. Less complete development would follow storage in Grasshopper Valley, on Ash Creek, or taken in connection with storage in Jess and West valleys, to the exclusion of use in Warm Spring Valley or around Alturas, the entire area of Big Valley might be watered.

BLACK CANYON.

This is a small area of 1,200 acres adjacent to Warm Spring Valley. The water supply depends on the run-off from the plateau to the north. Part of this is at present stored and used to irrigate 500 acres.

STONE COAL VALLEY.

This area of approximately 1,000 acres, of which 500 acres are now irrigated, is situated 10 miles north of Big Valley. A drainage area of 15 square miles is said locally to furnish more than enough water until about June 1 to irrigate about one half of the valley. If storage is feasible, and with economical use, water is at hand for watering all of the valley.

ASH CREEK VALLEY.

This area of 6,500 acres is on upper Ash Creek 20 miles east of Bieber, at an elevation of 5,100 feet. Several large ranches cover the valley, with 4,000 acres of wild hay reported irrigated. With Ash Creek, Cottonwood Creek, and springs there is water present under more economical use for all the land. A small reservoir on Cottonwood Creek carries some of the flood waters of that stream over to late summer. The watershed tributary to Ash Creek Valley approximates 110 square miles.

---

[1] U. S. Geol. Survey, Water Supply Papers 134, 177, 213, 251.

WEST VALLEY.

This area lies in a narrow strip along West Valley Creek, a tributary of South Fork of Pit River, 20 miles south of Alturas, at an elevation of 4,900 feet. The entire valley is in one ownership and all irrigated, the total area being 1,200 acres. This valley has been surveyed by the Reclamation Service[1] as a possible reservoir site, a 70-foot dam being estimated as capable of holding back 94,579 acre-feet. The average run-off at this site is not, however, sufficient to fill a reservoir as large as could be made here. The tributary watershed is 150 square miles.

JESS VALLEY.

This is also along a tributary of South Fork of Pit River, its area being 4,500 acres, of which 3,400 acres in alfalfa, wild hay, and grains is reported irrigated. The elevation of the agricultural land here is from 5,100 to 5,300 feet. Mill, East, and Harvey creeks, all perennial, furnish the water supply of the valley, these draining 91 square miles of elevated watershed and carrying an estimated combined minimum flow of 12 to 15 cubic feet per second. Surveys made by the Reclamation Service[1] show that a 60-foot dam in Jess Valley would give an impounding capacity of 224,560 acre-feet.

SUMMARY OF CONDITIONS ALONG UPPER PIT RIVER.

There are two main lines on which further irrigation development about Alturas and along Pit River both above and below Alturas might take place, and the future is likely to see results accomplished in some measure through a combination of these. The first involves a comprehensive scheme for the fullest possible utilization of all water sources available and the irrigation of the lands below them according to an orderly plan; the second involves the less economical but probably the more practicable development by the individual, community, or corporation, with each project wholly independent of any other. Whatever form development takes, it is bound to be intimately connected with irrigation in Sacramento Valley, because the Pit forms one of the important tributaries of the Sacramento.

Counting all agricultural areas along Pit River and main tributaries as far down as Big Valley, but omitting West and Jess valleys, because of their suitability for reservoirs, there are 163,300 acres. Assuming the possible ultimate use of Big and Round valleys as reservoirs for Sacramento Valley, 77,300 acres remain, of which 22,950 acres were reported watered in 1911, leaving about 54,000 acres still to be irrigated. This relatively small area should undoubtedly be brought under development. For this water could be made available from three main sources aside from the direct flow of Pit River, viz., Goose Lake, storage in West and Jess valleys, and smaller individual storage to which the topography of the country is well suited. In addition, pumping from underflow of the streams could be made to yield for lands not readily reached by gravity.

---

[1] U. S. Reclamation Service, 5th Annual Report.

Because of the possible ultimate use of Big and Round valleys, as well as of Ash Creek Valley, as reservoirs in connection with Sacramento Valley irrigation, any consideration of the use in Modoc County of the waters of the upper Pit must carry the reservation of possible alternative use lower down. Generally speaking, the drainage of the upper Pit is composed of relatively flat and sparsely timbered volcanic hills. Quite careful water-supply investigations covering this drainage have been made by the Geological Survey and Reclamation Service in connection with the Sacramento Valley irrigation project at one time proposed by the Reclamation Service.[1] In these studies, the use of Goose Lake water has been an important feature. This lake has a surface area of 186 square miles and a tributary watershed of 1,250 square miles. By diverting into Pit River sufficient water of Goose Lake to reduce its surface area to 83 square miles, it was estimated that the evaporation of 260,000 acre-feet per annum could be prevented, and this supply partly used along the upper Pit but mostly stored in Big Valley Reservoir, where a smaller exposed surface would reduce the evaporation losses. Reasoning from an assumed annual rainfall on the lake of 15 inches and from an assumed annual evaporation from the lake surface of 47 inches, the mean annual run-off from Goose Lake watershed figures approximately 300 acre-feet per square mile, or at least enough for the irrigation of 100 acres per square mile of drainage. A diversion channel from Goose Lake into North Fork of Pit River would be necessary to make this water supply available, because Goose Lake does not now overflow into the Pit.

Aside from Goose Lake, West Valley and Jess Valley reservoir sites furnish the principal means of storage for the upper Pit areas. With dams at these sites 70 feet and 60 feet high, respectively, the Reclamation Service has figured a storage capacity of 224,560 acre-feet at the former site and of 94,579 acre-feet of the latter.[2] The drainage areas tributary to these sites are not large enough, however, to fill the reservoirs. Two years' run-off from Jess Valley gave an average annual yield for 1904 and 1905 of 55,000 acre-feet, but as 1904 was a year of more than average rainfall, an average annual yield of 45,000 acre-feet gives a safer basis for estimate. Measured run-off from West Valley for the same period suggests a safe average yield of 20,000 acre-feet per year from this source. This total possible storage above the agricultural lands along the upper Pit of 65,000 acre-feet should, if fully and conservatively utilized, and supplemented by smaller individual storage, amply supply irrigation to the entire available area during periods of deficient direct flow.

---

[2] U. S. Reclamation Service, 5th Annual Report.

LITTLE AND DIXIE VALLEYS.

These are two small areas on tributaries of Pit River below Big Valley. The former, on Horse Creek, has an elevation of 4,200 feet, and an area of 900 acres, all irrigated. Dixie Valley, also on Horse Creek, has an elevation of 4,300 feet and an area of 2,900 acres, nearly all of which is held in Indian allotments, with 1,200 acres irrigated. Important development is not likely in either of these small areas, although the tributary watershed should supply all of the water needed for full irrigation development.

MADELINE PLAINS.

Madeline Plains, which form the next large agricultural area south of Alturas, lie at an elevation of 5,400 feet, and embrace a total of 153,000 acres, of which 3,900 acres were irrigated in 1911. Being a high plateau and until recently without railway transportation, this area has not reached a very extensive development. Several stock ranches have included irrigated areas, but until recently no attempt has been made to obtain a water supply for the general irrigation of the plains. For several years, however, a land and irrigation company has been prosecuting plans for the irrigation of 40,000 acres in the northern portion of the area, largely completing their canal system of 1911. The main source of water for this 40,000 acres as now developed is Tule Reservoir, into which Cedar Creek, with a drainage area of about 50 square miles above this reservoir, has been diverted. An additional supply has been contemplated by diversion of water from the upper Pit River drainage. Another small creek on the Van Lone ranch is utilized for irrigating about 1,000 acres there. For the eastern portion of Madeline Plains, the only stream sources are Red Rock, Painter, and Buckhorn creeks. Although these streams are snow-fed they are torrential and require storage for use. No gagings of value are available for any of the streams tributary to Madeline Plains. The four creeks named supply the main drainage, with a combined watershed of 217 square miles. If the normal annual rainfall on this watershed were 15 inches, and 20 per cent of this were collected in reservoirs and made available for irrigation, the total supply would be 54,250 acre-feet per annum, or very much less than enough to irrigate the entire Madeline Plains.[1]

DRY VALLEY.

This area of about 3,000 acres lies southwest of Madeline Plains at an elevation of 5,500 feet. No land is irrigated and the only water that enters the valley is torrential and comes in at the north end and sinks before becoming available for use. About 10 square miles of watershed might supply water for approximately 500 acres if storage were feasible, but no such development seems possible.

---

[1] Records of the Geological Survey for 1904 and 1905, as given in Water Supply Papers 134 and 137, show that West Valley Creek, adjacent to Cedar Creek, had a mean measured run-off of 3 inches in depth over the entire area of watershed. Ash Creek, at Adin, 30 miles west, and with a watershed of 260 square miles, gave a measured run-off of 7 inches in depth.

GRASSHOPPER VALLEY.

This area of 6,300 acres also lies southwest of Madeline Plains, with an elevation about 300 feet lower than Dry Valley. About 1,900 acres in wild hay, timothy hay, and grains are now irrigated from two small spring-fed creeks and several small reservoirs. The south end of the valley is a lake which covers about 3,500 acres at times of high water and about 1,500 acres at times of low water, the 2,000 acres of overflow land being cut for hay when the lake recedes. All of the valley, excepting 600 acres, is held in one ranch. Storage in additional small reservoirs or pumping, if underground water is present, will be necesary for increasing the irrigated area.

PAINTERS FLAT.

This small area of 2,000 acres lies along the California-Nevada line southeast of Madeline Plains. It is now used for grazing and as no water supply seems to be at hand for use in irrigation, the area is of no irrigation importance.

SNAKE CREEK AND RUSH CREEK AREAS.

These two areas, aggregating 4,700 acres, border small streams rising in California and draining into Nevada. All of the valley land along Snake Creek, or about 600 acres, is irrigated from springs. Rush Creek is torrential and but little land along it is cultivated. The drainage tributary to this creek approximates 40 square miles of bare hills of low run-off yield, and little irrigation is likely here.

HONEY LAKE VALLEY.

Including Susan River Valley, Willow Creek Valley, Long Valley, and the areas about Honey Lake and along the minor streams draining into it, Honey Lake Valley constitutes the largest and most readily accessible aricultural area in northeastern California. Probably no area of equal importance in California has been more adversely affected by lack of public regulation of water resources. The total area of the valley is substantially 243,000 acres, of which 45,700 acres, including the naturally overflowed and crudely flooded areas, was found to be irrigated in 1911. While a large area of agricultural land lies northeast of Honey Lake, the great bulk of the valley is southeast of the lake and farthest from any water sources other than such as can be found underground. Irrigation has been practiced in this valley for many years and there are numerous canals and ditches leading from Susan River, Willow Creek, and the other streams entering the valley. Aside from one company system from Susan River and two small coöperative associations that have installed pumping plants on Honey Lake, irrigation is effected wholly by individual or small partnership enterprise. The highest irrigation development is along Susan River east of Susanville, although even there use is exceedingly wasteful. Farther down, in the Susan River delta, it is little more than the annual submerging of wild grass meadows, under practices perhaps satisfactory to the irrigators themselves and carried on under authority of numerous court decisions, yet which are criminally uneconomic from the point of view of the full development of the entire valley. The only important storage at present used on Susan River is in connection with the principal irrigation company of the valley, which uses McCoy Flat and Hog Flat reservoirs, tributary to Susan River above Susanville, and Lake Leavitt, an artificial reservoir in the valley below Susanville.

In estimating the water resources available for possible increased irrigation in Honey Lake Valley, first place must be given to Susan River. According to scattering records at Susanville kept by the Geological Survey from 1901 to 1905[1] the estimated mean annual run-off of this stream is substantially 102,000 acre-feet. Based on private unpublished reports of several engineers and data gathered by this office, Willow Creek, Petes Creek, Horse Lake, Secret Valley drainage, Long Valley Creek, and the smaller streams of Honey Lake Valley proper, probably yield in mean years 111,000 acre-feet additional, making a total mean run-off for the valley of 213,000 acre-feet. Additional yields have been estimated by some from Eagle, Caribou, Silver, and Feather lakes, but these are not included in the above total. Estimates of the total water-crop have from time to time been made on the basis of evaporation from Honey Lake at an assumed rate of 3.5 feet per annum over a surface of 60,000 acres, giving a total of 210,000 acre-feet. Whatever the actual run-off of the valley, it can not all be stored or used economically in direct flow. Full storage is not probable on Long Valley Creek or on the small streams entering the main valley. Assuming that a part of the flow of Susan River can be diverted into and stored in Eagle Lake, which is the largest natural reservoir site in the valley,[2] and counting that what cannot be held in the upper reservoirs can be stored in Lake Leavitt, full storage should be feasible on this stream. Round Valley, or Willow Creek, and Horse Lake, on Petes Creek, have been figured to store most of the flow of these two streams not used in direct irrigation. Some of the run-off from Secret Valley and Ball Canyon Creek can also undoubtedly be stored. Analyzing these various probable storages in connection with the figures of estimated run-off already given, and figuring on a mixed duty of 1.5 acre-feet per acre under direct use and 2 acre-feet per acre under storage, the probable practical irrigation development in this valley from surface sources is not over 117,500 acres, of which, including Secret Valley, 47,000 acres were receiving water in 1911. The possibilities of irrigation by pumping in this valley are problematical. As already stated, two pumping plants are taking water direct from Honey Lake for irrigation purposes, and a number of irrigation wells have been sunk in the large area southeast of Honey Lake. While there will always be ample water in Honey Lake, its value for irrigation is likely to be small because of the excessive amounts of salts present. Salts in considerable quantities are also carried in some of the well waters, and each well sunk must be tested for quality as well as for quantity before its value can be determined.[1]

---

[1] U. S. Geol. Survey Water Supply Papers 134 and 177.

[2] Many have believed that Eagle Lake could be made to water all of Honey Lake Valley and a tunnel was partly completed to tap it. Evaporation, however, has generally taken care of the entire run-off into it, except that 5,000 to 7,500 acre-feet are found to seep annually from the late to feed springs at the head of Willow Creek. During recent years the surface of Eagle Lake has raised slightly. The best that the more conservative estimates have allowed for the lake is to furnish a supplemental supply in years of unusual drought.

SUMMARY.

Recapitulating the irrigation resources of this division of California, the following facts seem clear: There is a total of 866,500 acres of agricultural land reported that is topographically suited for irrigation, with 161,850 acres reported irrigated in 1911, the summer flow of the streams being quite largely diverted and some water stored. Both increased economy in present use, that is in some instances exceedingly wasteful, and additional storage will result in an increased irrigation development, its extent dependent on the water supplies available to the various areas. What these supplies are and something of their character are stated in the tabular summary. Some stream records are available and estimates of the mean annual flow can be approximated in others. For the Great Basin area, including surprise Valley, Madeline Plains, and Honey Lake Basin, 400,000 acre-feet is believed to be a fair figure for the total water crop that might be utilized. For the Pit River drainage down to and including Big Valley, 730,000 is the mean measured run-off. If the area of Goose Lake were reduced as at one time proposed by the Reclamation Service and evaporation of a large quantity of water thereby lessened, and if Lost River drainage waters in California were utilized in California, which is not likely, the total mean available yield in this division outside of the Great Basin drainage might safely be estimated at 1,000,000 acre-feet per annum. If these large water-yields were available over this entire division as land is at hand on which it might be used, a large part of the 866,300 acres of irrigable agricultural land might be watered. Considering conditions of land and water as they are, however, and assuming for this purpose that both Big Valley and Round Valley will be fully developed agriculturally rather than as reservoirs for Sacramento Valley, it is believed that doubling the present irrigated area of 161,850 in this division will at least be the maximum development that will be reached. If Big Valley and Round Valley are utilized as reservoirs for Sacramento this total should be decreased by 80,000 acres.

---

[1] In July, 1912, samples of water from Honey Lake and 7 wells southeast of it were analyzed to determine their suitability for irrigation purposes by Prof. Geo. E. Colby, of the California Agricultural Experiment Station. The water from 2 of these wells was reported by Professor Colby as "excellent" for irrigation, that from 3 was reported "suitable," that from 1 "unsuitable." and that from 1 of such quality as "might answer for irrigation on well-drained land." The water analyzed from Honey Lake showed 11.03 pounds of corrosive alkali per 1,000 gallons of water, or enough to deposit 1.8 tons with each acre-foot of water applied. Analysis of water taken from this lake in December, 1909, and May, 1911, showed 5.90 and 7.10 pounds of corrosive alkali, respectively, per 1,000 gallons of water.

FEATHER RIVER VALLEYS.

West of the crest of the Sierra Nevada in northern California are a number of high mountain valleys of considerable importance both locally and in the aggregate. These lie north of the overland route of the Southern Pacific Railroad and generally along or tributary to the Western Pacific Railway in Plumas and Sierra counties. The elevations of these valleys vary from 3,400 to 5,800 feet. They are therefore all well above the Sierra foothills treated elsewhere and are properly classified as high mountain areas. Irrigation here is almost wholly that of the mountain meadow on which wild hay and a less amount of grain and alfalfa are grown. All of the division is within the upper drainage of Feather River where the heavy annual precipitation of rain and snow gives the streams a volume greatly out of proportion to any needs in this division for irrigation. The normal annual precipitation at stations for which the United States Weather Bureau has records for ten years or more is 42.5 inches at Greenville, 46.3 inches at Quincy, and 89.2 inches at La Porte. Gagings of Feather River at Oroville[1] show an average annual run-off of about 1,600 acre-feet per square mile, or the equivalent of a depth of 30 inches over the entire drainage. Big Meadows, an area of 14,500 acres in this division, is being utilized by the Great Western Power Company for a reservoir, and the lands there consequently have no further agricultural value. In 1909, however, prior to beginning construction on the Big Meadows dam, 1,100 acres were reported irrigated.

SUMMARY OF VALLEY AGRICULTURAL AND IRRIGATED AREAS.

The following summary lists the valley agricultural and irrigated areas in this division of northern California:

Summary of valley agricultural and irrigated areas in the high mountain valleys in Plumas, Sierra, and southwestern Lassen counties.

Area.	County or counties.	Valley agricultural land.	Area irrigated.
		Acres.	Acres.
Sierra Valley	Sierra and Plumas	101,000	23,900
Mountain Meadows	Lassen	13,000	400
Big Meadows	Plumas	----------	1,000
Indian Valley	Plumas	11,000	5,900
Genesee Valley	Plumas	3,100	2,900
Meadow and Spanish Ranch valleys	Plumas	2,250	500
American Valley	Plumas	4,300	4,000
Long and Mohawk valleys	Plumas	1,400	550
Red Clover Valley	Plumas	4,250	2,100
Grizzly Valley	Plumas	8,200	100
Scattering	Plumas	9,500	9,250
Totals	----------	158,000	50,600

---

[1] U. S. Geol. Survey Water Supply Paper.

SIERRA VALLEY.

This valley containing 101,000 acres, the largest agricultural area in the division, is at the head of Middle Fork of Feather River, in Sierra and Plumas counties, at a mean elevation of 4,900 feet. The soil of the valley is generally a sandy loam covered in its natural state with a heavy growth of sage and rabbit brush. Some adobe and a little alkali are found in the center of the valley. Continuous rainfall data are not at hand but the fall in 1910 is officially reported for Sierraville in the Weather Bureau records as 17.49 inches. The area reported irrigated in 1911 was 23,900 acres, most of this being north of Sierraville near Loyalton, and on Last Chance Creek. The crops irrigated are the wild hay and alfalfa typical of the division, but the area is generally believed to be suited to sugar beets, although they have thus far been grown only experimentally. With economical use, water is available for the whole of Sierra Valley and eventually, especially if beet culture is successfully introduced, 75 per cent or more of the total acreage may be expected to be receiving water. At present the supply is so abundant north of Sierraville and along Last Chance Creek during flood flow that irrigation is more a matter of distribution than of diversion, low dams and crude ditches carrying the water wild over the meadows. Near Loyalton the water supply is less abundant but one 15-acre reservoir already built indicates the possibilities of small-scale storage. The sources of the water supply now available to Sierra Valley are Last Chance, Smithneck, and Hamlin creeks, underground waters, and springs. While the annual flow in the creeks is large, as indicated by the heavy average run-off of Feather River already mentioned, storage is needed before it can be made available. Sites have been locally surveyed on Last Chance Creek and in the neck of Sierra Valley near Sierraville and ample capacity reported but not officially confirmed. For the Sierraville reservoir water would need to come from Middle Fork of the Feather River. The trough of the valley is naturally moist and underground water is present in considerable quantity, the full extent of which, however, no data are at hand to indicate. Northward from Sierraville quite a body of land is overflowed during floods and the building of drainage works for this has been contemplated but not executed. If present wasteful use can be superseded by more reasonable practice, at least part of the available storage built, some water pumped where the lifts are economical, and possible conflicts with power rights on the Feather avoided or adjusted, the estimated possible increase in the irrigated area of Sierra Valley indicated above is conservative.

MOUNTAIN MEADOWS.

This is an agricultural area of 13,000 acres on North Fork of Feather River in southwestern Lassen County at an elevation of 4,700 feet. Four hundred acres in wild hay and timothy were irrigated in 1911 by means of sloughs and 4 private ditches. The water supply for this valley is a tributary of Rock Creek, which is a tributary of

North Fork of Feather. The minimum flow of the creek is estimated at 20 cubic feet per second. but the seasonal supply, by greater use in spring, would irrigate a much larger area than the minimum flow furnishes. Storage in the upper one fifth of the valley would give water for nearly the entire lower four fifths, but this has not been seriously contemplated and if undertaken might conflict with power rights in Big Meadows below. Until greater use is made of the summer flow, storage will not assume any importance. Aside from possible conflict in water rights, the entire area can be classed as irrigable.

INDIAN VALLEY.

This is a mountain valley 12 miles north of Quincy on Indian Creek, a tributary of North Fork of Feather, at an elevation of 3,500 feet. At present practically the entire valley is in grain, wild hay, timothy, and alfalfa, 5,900 acres being reported irrigated. The use of the valley as a reservoir site has been considered,[1] the measured annual run-off at Crescent Mills from the tributary watershed of 790 square miles having averaged 600,000 acre-feet from 1906 to 1909, with the normal annual run-off estimated by the Reclamation Service at 500,000 acre-feet. Besides Indian Creek, Cook's Canyon, Lights, and Wolf creeks enter the valley. While the area artificially irrigated is only 5,900 acres, nearly all of the remainder of the valley receives natural irrigation during high water. Much of the valley needs drainage, but it can all be classed as irrigable.

GENESEE VALLEY.

About 10 miles northeast of Quincy there is another small area, known as Genesee Valley, on Indian Creek. The elevation of this valley is approximately 3,800 feet. Of a total of 3,100 acres, 2,900 acres, in two large ranches, are reported irrigated, the irrigated crops being the grain and wild hay typical of the region. The water supply available is of course ample.

MEADOW AND SPANISH RANCH VALLEYS.

Together these form an area of approximately 2,250 acres 9 miles west of Quincy lying at an elevation of 3,800 feet. They are comparatively flat valleys merging into rolling foothills and are watered by Spanish Creek and various small tributaries having a combined drainage area of 45 square miles. One small reservoir has been built at the head of Spanish Ranch Valley. The valleys were formerly heavily timbered and are now only partially cleared, 500 acres in wild hay being reported irrigated. At present crops are chiefly confined to the flat bottoms, but where the higher adjoining areas have been cleared, planted, and irrigated, growth is very satisfactory. Water is ample if properly used for irrigating the entire Meadow Valley and Spanish Ranch Valley areas.

---

[1] U. S. Reclamation Service, 5th Annual Report.

AMERICAN VALLEY.

This is a flat valley of 4,300 acres in the vicinity of Quincy at an elevation of 3,400 feet. The usual mountain forage and grain crops are grown, 4,000 acres being under private irrigation ditches, with an ample water supply obtained from Thompson, Spring Garden, Taylor, and Spanish creeks. American Valley has been considered as a reservoir site, for which the Reclamation Service found a run-off of 86,055 acre-feet available.[1] It hardly seems likely, however, that this valley will be so utilized.

LONG AND MOHAWK VALLEYS.

These are two narrow areas of 400 and 1,000 acres, respectively, lying along Middle Fork of Feather River in southern Plumas County at elevations of 4,300 to 4,500 feet. A total of 550 acres in scattered pieces is reported irrigated in the two valleys where the agricultural land has been cleared of timber, and there is ample water for the entire areas.

RED CLOVER VALLEY.

This valley lies at an elevation of 5,400 feet along Red Clover Creek, a tributary of Indian Creek, northwest of Sierra Valley. Of a total of 4,250 acres of agricultural land, 2,100 acres are reported irrigated. The run-off from 127 square miles of watershed is ample if it can be controlled.

GRIZZLY VALLEY.

This is a tributary area to Sierra Valley, but being at an elevation of 5,800 feet it is now used for pasture and none of it irrigated. A tributary drainage of 33 square miles furnishes sufficient water for irrigation but the high elevation makes irrigation unlikely. The Reclamation Service reports a reservoir site here with a capacity of 62,000 acre-feet, with 20,000 acre-feet estimated as annually available.[1]

SUMMARY.

Recapitulating the data for the northern Sierra or Feather River valleys, it is found that 158,000 acres are valley agricultural land, with 50,600 acres in wild hay, grains, and alfalfa irrigated. Eliminating Grizzly Valley, because of its high elevation, the valley agricultural area becomes 149,800 acres. The water supply of the areas is in nearly every case ample for irrigating all of the land, but its utilization would involve storage, some pumping in Sierra Valley, and an adjustment or avoidance of conflicts in rights between irrigators and power interests. These valleys being in the main best suited to forage crops, and much of the soil in them being permanently relatively moist, it is not likely that the use of water in irrigation will materially lessen the flow to power and irrigation interests below. Other areas than Big Meadows are sure to be eventually used for reservoir sites for both power and irrigation in Sacramento Valley. If it were not for this fact, an estimate of 65,000 acres as the additional area that will be watered in the future would seem safe.

---

[1] U. S. Reclamation Service, 5th Annual Report.

NORTHERN SIERRA FOOTHILLS.

Between the Feather River valleys and the plains of Sacramento Valley is situated the important zone of the Sierra foothills. Through these foothills must pass the many streams that originate in the higher portions of the Sierra and seek their outlet into Sacramento Valley below. The agricultural areas in these foothills are not continuously cultivable, nor are the areas that are cultivable usually valley areas, but rather the more even portions of countless spurs and ridges that are separated by rocky promontories and deep and rugged canyons and gulches. The non-agricultural areas are sometimes so rough as to have little or no value, even for grazing. The natural growth of the foothill belt is mostly brush and non-merchantable timber, the merchantable forests being on the higher slopes of the mountains. The soils are of the reddish types of granitic or volcanic origin and when irrigated are exceedingly fertile. Favorable climatic conditions and water, when available, add to these soils in making the region attractive for fruit growing, and where railroad transportation is easy of access and mining interests are not still paramount, considerable development has been accomplished, especially about Auburn and Newcastle. About 35 per cent of the deciduous fruits shipped from California are taken from the foothill areas of Placer County alone.

As already stated, the water supplies available to the Sierra foothills are the streams crossing them from the higher elevations of the Sierra on the east. In few cases are these streams easy of delivery to the cultivable areas. The larger streams—Feather, Yuba, Bear, American, and Cosumnes rivers—and their forks and main branches flow in deep canyons, making long conduits sometimes necessary to carry their waters to the irrigable lands. Fortunately many of the ditches and pipe-lines of the early-day mining camps, built at costs running into millions of dollars, have been rendered available to more permanent use in irrigation and power, thus making it possible in many cases to water lands whose agricultural products might not alone have yet justified the expense of bringing water to them. But not all of the water that passes through the foothills is available to them, for present and future irrigation development in Sacramento Valley and the hydroelectric power rights that have already become vested or that will become vested in the future, together make it certain that much of the foothill land is destined to remain without irrigation.

The Sierra foothill areas in northern California extend from the vicinity of Whitmore, east of Redding, south through Amador County.

SUMMARY OF AGRICULTURAL AND IRRIGATED AREAS.

The following tabular summary groups them by counties and according to their location between the principal river systems, giving also the acreages of agricultural and irrigated land.

Summary of agricultural and irrigated areas in northern Sierra foothills.

Area.	County or counties.	Agricultural land. Acres.	Area irrigated. Acres.
North of Feather River:			
Whitmore	Tehama and Butte	24,000	10,262
Paradise Ridge	Butte	12,000	700
Between Feather and Yuba rivers:			
Wyandotte-Bangor	Butte and Yuba	38,000	1,395
Browns Valley	Yuba	25,000	1,750
Between Yuba and Bear Rivers:			
Nevada City-Smartville	Yuba and Nevada	117,000	4,013
Between Bear and American rivers:			
Placer County fruit districts	Placer	104,000	14,000
Orange Vale-Fair Oaks	Sacramento	29,000	4,450
Between American and Cosumnes rivers:			
Georgetown	El Dorado	42,000	1,546
Placerville	El Dorado	26,000	1,613
Folsom-Pleasant Valley	El Dorado and Sacramento	148,000	1,100
South of Cosumnes River:			
Ione-Jackson	Sacramento and Amador	220,000	630
Scattering, unlocated		4,000	3,791
Totals		789,000	45,250

WHITMORE FOOTHILL AREA.

This is a broken area west of Millville, and from Whitmore south to Paynes Creek, lying along or adjacent to the small northeastern tributaries of the Sacramento below the Pit. Counting both the small pockets of creek bottoms and arable foothills, the total area is roughly estimated as 24,000 acres, of which 10,000 acres are along North and South Cow, Oak Run, upper Bear, and Clover creeks, and 2,000 acres are along Paynes, Plum, and Ripley creeks. The agricultural areas are, individually, relatively small and scattered, the surrounding country being hilly and timbered and similar throughout the area. In addition to the creeks named, several smaller streams furnish the available water supply for irrigation. No gagings are at hand for any of these streams, but the area has a total watershed of approximately 250 square miles, reaching elevations of 4,000 to 6,000 feet at the headwaters of the creeks, and an estimated rainfall of 35 to 50 inches. There is, therefore, ample water within the watershed for covering the irrigable lands but storage would be necessary to make it available for greatly increased use. At present 10,262 acres are reported irrigated, 75 per cent of which is between Millville and Whitmore. Filings have been made on nearly all of the streams for powe purposes and much land on which water has been used for irrigatio has been purchased by the Northern California Power Company an the use of the water changed from irrigation to power. In spite o the heavy normal rainfall, the agricultural lands without a wate supply for irrigation have a grazing value only. The irrigated crop from Millville to Whitmore are chiefly clover, timothy, grain, alfalfa and hops. About Manton and Paynes Creek apples and other deciduous crops are important. Where the use of water has been changed t power, numerous areas formerly irrigated have been abandoned. I the ascendency of power interests continues, agricultural values will decrease, except as bottoms continue to produce without water or irrigation supplies are pumped to the most accessible areas from the stream gravels.

PARADISE RIDGE.

This is an area of about 12,000 acres on the ridge between Butte Creek and West Branch of Feather River at a mean elevation approximating 1,900 feet. Lying on the Butte County Railroad 15 miles east of Chico, it is off the main lines of travel but still has rail communication with the centers. Production is mainly deciduous fruits and berries and with additional water the district could be cultivated nearly to the limits of its acreage. The present supply comes mainly from Little Butte Creek through a small ditch owned by the Oro Water, Light and Power Company, this ditch gaining the ridge near Magalia, where it irrigates about 600 acres, and then continues to join a ditch from West Branch of Feather River furnishing water for power and irrigation about Oroville. An additional small supply, irrigating 90 to 100 acres about Magalia, is obtained from the old Cherokee Mining Ditch, owned by the Pacific Gas and Electric Company. Cherokee Ditch obtains water from a branch of Big Butte Creek opposite Powelton and carries it to Spring Valley Reservoir across West Branch of Feather River near Concow, the only present use being that for irrigation near Magalia. A large supply of irrigation water per acre is not needed on Paradise Ridge and there is probably a sufficient annual run-off from 13 square miles on Little Butte Creek alone to supply the entire area if it could be stored and power rights were not conflicting. Even if Little Butte Creek should fail to furnish enough water its flow could be supplemented by diversion into it of some small tributary of West Branch of Feather River on the north and east. Or, with cheap power, there seems no reason why some water can not eventually be pumped from West Branch of Feather River at some point between Paradise Ridge and Stirling from which a gravity conduit could carry it economically to the ridge. One privately surveyed storage site is available on Little Butte Creek a short distance above Magalia which, if available to Paradise Ridge, would care for much of the present shortage. Other sites are also undoubtedly at hand. Taken altogether, as deciduous fruits justify a considerable expense for water, it seems reasonable to class all of the Paradise Ridge as ultimately irrigable. One acre-foot per acre per year delivered at the small holdings would suffice for most of the area if only that amount could be furnished economically.

WYANDOTTE-BANGOR AREA.

East of the plains country about Oroville and Palermo and north of Honcut Creek, in the general vicinity of Wyandotte and Bangor, and below the 1,000-foot contour, 38,000 acres of rolling foothills that are now partially covered by the South Feather Land and Water Company have been classed as irrigable. This land is covered with the scrub oak, chaparral, and digger pine characteristic of the low Sierra foothills and when cleared and irrigated is considered very satisfactory for the growth of both deciduous and citrus fruits. Present cultivation extends up to elevations of 900 and 1,000 feet, and in 1912, 1,395 acres were reported irrigated. The water supply of this area now comes from Lost, Orleva, and Pinkard creeks, all tributaries of South Fork of Feather River, Lost Creek being most dependable for summer flow. It is locally estimated that 5,000 acres are susceptible of irrigation through the Forbestown Ditch and its branches of the South Feather Land and Water Company. The normal rainfall at Oroville, seven miles west of Wyandotte, is 28.4 inches, and the rainfall on the watershed of the creeks supplying the area is above that. Irrigation here will be involved with irrigation in the Palermo section. A watershed of 107 square miles is tributary to South Fork of Feather River above the latter, and with two thirds of the average rate of run-off of the entire Feather above Oroville, this would supply 128,400 acre-feet of water per annum if it could all be conserved. What proportion of the available supply can be used in the Wyandotte-Bangor area, however, cannot be satisfactorily estimated. In addition to South Fork and its tributaries, Honcut Creek and its numerous branches passes through the area and if storage is feasible on it, could be made to add to the supply if its use were not forced lower down on the plains and small bottoms about Honcut.

BROWNS VALLEY AREA.

This is an area of indeterminate extent of which 25,000 acres centering about 15 miles east of Marysville are classed as irrigable. The lands here have an elevation of 300 to 500 feet and possess physical conditions similar to those of the Wyandotte-Bangor area adjoining it above Honcut Creek directly to the north. Between 1888 and 1893 approximately $175,000, in bonds, was spent through the medium of Browns Valley Irrigation District to supply water to this area from North Fork of Yuba River. At present only 1,750 acres are irrigated and this area receives water by virtue of a contract with the Pacific Gas and Electric Company in accordance with which that company maintains and operates the district canals in conjunction with a power installation above the irrigable lands, and at an annual cost to the irrigators of $3 per miner's inch. The main ditch of Browns Valley District heads in North Fork of Yuba River a short distance above the latter's junction with Middle Fork, the tributary watershed above the point of diversion being 490 square miles. The measured discharge of Yuba River at Smartsville for the years 1903 to 1910[1] shows a mean annual run-off for the entire Yuba of 2,640 acre-feet per square mile. If this mean can be applied to North Fork the annual run-off above Browns Valley Ditch is 1,790,000 acre-feet. There can be no question that water is available for the entire irrigable portion of the Browns Valley area if the course of development permits its use there.

NEVADA CITY-SMARTSVILLE AREA.

Between Yuba and South Fork of Yuba and Bear rivers, and extending in regular and broken patches from the Sacramento Valley plains to an elevation of 2,500 feet east of Nevada City and Grass Valley, 106,000 acres are more or less roughly estimated as agricultural and within the general range of water for irrigation. Of this 4,013 acres is now reported irrigated, of which 1,000 acres is under the ditches of the Excelsior Water and Mining Company along the ridges from Smartsville to Nevada City. Some land is also watered south of Smartsville about Spenceville and Cabbage Patch, as well as along Wold Creek and its tributaries south of Grass Valley. With the exception of a small acreage about Smartsville and Cabbage Patch in Sacramento County, all of the area is in Nevada County. An additional area of 11,000 acres of the same character lies between Middle and South forks of Yuba River, also in Nevada County, from North San Juan east to Paterson and south of French Corral.

The entire Nevada City-Smartsville area is still more devoted to mining than to agriculture, the principal ditches carrying more water for the former purpose than the latter. While the normal rainfall at Nevada City has been more than 55 inches for a period of nineteen years, the rapid run-off, relatively shallow mountain soils, and summer droughts make irrigation necessary. The crops grown are alfalfa and wild grasses on the lower lands and grain, hay, deciduous and some citrus fruits, and small gardens, all chiefly for local consumption. The water supply now diverted to the area comes partly from many small creeks but mainly from South Fork of Yuba River. The principal creeks furnishing irrigation water are Deer Creek above Nevada City, Squirrel Creek, in Penn Valley, and Wolf Creek, south of Grass Valley. Excelsior Water Company claims all of the water of Deer Creek and in South Yuba River and tributaries below or west of the South Yuba Water Company's system. The annual yield of South Fork of Yuba River above the heading of Excelsior Ditch, at the average yield per square mile for the entire Yuba of 2,640 acre-feet, is enough for irrigating all of the area tributary to its ditches but it will not all be used there. Improvements under way in 1911 contemplated making the system susceptible of irrigating 5,000 acres. It has further been estimated that with the future decline of mining 40,000 acres can be brought under the system, but this is probably an excess figure. For the area about North San Juan only small local streams are economically available for irrigation. For the areas about Cabbage Patch and Spenceville and along Wolf Creek, Bear River might be diverted but the use of that stream, whose summer flow is small, is not likely on these high areas. If 25 per cent of the agricultural land in the Nevada City-Smartsville area, or approximately 30,000 acres, is eventually irrigated, development will then have reached the limit of what now seems reasonably to be expected.

---

[1] U. S. Geol. Survey Water Supply Paper 298.

PLACER COUNTY FRUIT DISTRICTS.

South of Bear River and north of North Fork of American River the Sierra foothills have reached their highest agricultural development in northern California. The arable foothill lands between these two streams are similar to those north of Bear River, but the presence of more of the old mining ditches and of more accessible railroad transportation have resulted in a very much larger area being brought under irrigation. Of 134,000 acres classified as arable between these two rivers, 104,000 acres embrace the Placer County fruit districts that are now irrigated to the extent of 14,000[1] acres by the various conduits of the South Yuba Water Company, owned by the Pacific Gas and Electric Company. The water supply of South Yuba Water Company, which is used for power as well as for irrigation, comes from Bear and South Yuba rivers, and is distributed through twenty lakes and reservoirs, with a capacity of 46,500 acre-feet, and 265 miles of ditches and pipe lines, the present total diversions being 130 cubic feet per second. From the various sources and storage reservoirs, the collected waters pass to Lake Spaulding, which has been acting as the final storage and distributing point of the system. The enlargement of the Lake Spaulding storage to a capacity of 91,800 acre-feet is now in progress in connection with the hydroelectric development of the Pacific Gas and Electric Company, and the water, after use in generating power from this and the other storage is to be returned to Bear River for re-diversion for irrigation purposes. The total quantity to be diverted by the company under its enlarged development will be 350 cubic feet per second. After re-diversion from Bear River the water is to be used on about 35,000 acres between American and Bear rivers and on areas extending from Applegate to Roseville and Lincoln.

The Placer County fruit district, of which the main towns are Newcastle, Auburn, Penryn, Loomis, and Rocklin, is the largest center of mountain fruit growing in California. Although a 40-year rainfall record at Auburn shows a mean annual precipitation of 35.13 inches, irrigation is necessary owing to the steep ground slopes and the relatively shallow soils. With small quantities of water—the duty is claimed to average 1 inch to 7 acres—fruit growing is successful. Water is sold to irrigators in these districts at the flat rate of $45 per miner's inch per year, and is used by the irrigators in small continuous streams and distributed to the orchards in contour furrows.

---

[1] Later data shows the irrigated area in 1912 to be 15,000 acres.

A 50 per cent development in these fruit districts would more than treble the present irrigated area.

ORANGEVILLE-FAIR OAKS AREA.

This is a continuation of the foothill area of the Placer County fruit districts, lying north of American River in Sacramento County, beginning about 10 miles northeast of Sacramento. The slopes are less steep here than in the foothills farther north. Approximately 29,000 acres are embraced in the area, of which 4,450 are reported irrigated. Aside from springs and a few small creeks watering about 450 acres, the main water supply now available to the area is that of the American Canyon Water Company. This company obtains water from North Fork of American River southeast of Auburn which it delivers through three reservoirs, 25 miles of main canal, and 27 miles of steel pipe to Orangeville and Fair Oaks colonies. Of 4,000 acres irrigated in these colonies, approximately 3,200 acres are in orchards, largely citrus, 200 acres in vineyards, 80 acres in alfalfa, and the remainder in lawns, gardens, and berries. In all, 11,000 acres in the two colonies are now piped for water distribution.

Ultimate irrigation development here as elsewhere in the foothills depends on the water supply that can be made available from the large streams. Gagings are not at hand for North Fork of American River, but the Geological Survey record for the entire American River at Folsom shows an average annual run-off per square mile of watershed of 1900 acre-feet, over one half of the total watershed of 1,910 square miles being on North and South forks. But while the annual flow of North Fork of American River is large, the summer flow is small and adequate for only a relatively small area without storage, and no data are at hand with reference to the possibilities of that. As in the Placer County fruit districts, water is distributed to orchards here in contour furrows, but at present under a flat annual acre charge of $3.

AREAS BETWEEN AMERICAN AND COSUMNES RIVERS.

South of North and Middle forks of American River and north of the Cosumnes 216,000 acres have roughly been classed as agricultural land by throwing out all land known to be too rocky or too steep for cultivation below an elevation of 2,500 feet. Adjoining the Sacramento Valley plains areas is a large area of now barren and slightly rolling land of which part is devoted to grain growing and a larger acreage to grazing. From there to an elevation of 2,500 feet the area is very much broken and only the tops of the ridges and their more gently sloping sides are susceptible of cultivation. Between Middle and South forks of American River 42,000 acres of the total are situated, the center of this area being Georgetown. In 1911 the area reported irrigated there was 1,546 acres, supplied by the Loon Lake Water and Power Company, one branch of their system extending to the vicinity of Cool and another to Garden Valley and Kelsey. The Loon Lake Company contemplates considerable storage and estimates that their system can be extended to cover 15,000 acres. Between South Fork of American River and Weber Creek are 26,000 acres of agricultural land with Placerville the main center. Here the Sierra Water Supply Company furnish water for approximately 1,000 acres in the vicinity of Placerville and Granite Hill. The diversion of this company is from South Fork of American River 31 miles above Placerville and their distribution is mainly through old mining ditches as elsewhere in the foothills. The Ranchers Ditch Company irrigates about 200 acres in the vicinity of Coloma, and an additional scattered irrigated area of 413 acres is reported. The mean annual precipitation at Placerville covering a period of 34 years is 45.59 inches and profitable agriculture is possible without irrigation, but irrigation here as elsewhere in the foothills is necessary for commercial fruit growing and its considerable extension is looked for. The remainder of the agricultural lands between American and Cosumnes rivers, aggregating approximately 148,000 acres, extend from Folsom to Pleasant Valley. At present 1,100 acres are reported irrigated. The land nearest the Sacramento Valley plains is generally shallow and not promising for irrigation development, but from Shingle Springs to Pleasant Valley, at elevations of 1,500 to 2,500 feet, better areas are found. The Diamond Ridge ditches, forming the Crawford Ditch system, now water about 500 acres near Diamond, El Dorado, and Shingle Springs by diverting water mainly from North Fork of Cosumnes River at Steely's Ford but also, en route from Camp, Clear, Squaw Hollow, and other creeks. This system comprises about 80 miles of main ditches and laterals originally used exclusively for mining and thus covers a rather extensive territory in which water will be more and more used for irrigation.

IONE-JACKSON AREA.

Another large and undeveloped foothill area, with the roughly classified agricultural lands scaling to 220,000 acres, lies south of Cosumnes River in Sacramento and Amador counties. At present the irrigated area reported is only 630 acres with but little further development active. Much of the soil roughly classified as agricultural, like much of that in the foothill areas farther north, is too thin for satisfactory cropping, but when the soil is sufficiently deep all kinds of deciduous fruits are successfully grown in small family orchards and flourishing vineyards are to be seen on the hillsides near Jackson. Mining still predominates in Amador County. The greatest present agricultural growth is in Jackson and Ione valleys, together comprising about 18,000 acres, along Jackson and Sutter creeks. Alfalfa is grown without surface irrigation along the main creek bottoms, but grains form the main crops and stockraising is the chief agricultural industry. More intensive development has been retarded here by large holdings. Counting Cosumnes and Mokelumne rivers, with mean annual discharges at the gaging stations of the Geological Survey at Michigan Bar and Clements of 571 and 1,440 cubic feet per second, respectively, or of 404,000 and 1,040,000 acre-feet,[1] there is a large supply of water tributary to this area. What portion of this is to be stored and used in the foothills rather than in Sacramento and San Joaquin valleys cannot be estimated. A number of water systems are operating in this area, owned principally by the Pacific Gas and Electric Company, the Amador and Volcano Mining and Land Company, Hayward, Hobart, and Lane, and the Lancha Plana Irrigation and Mining Company. These systems are chiefly used for mining or power and irrigation under them is incidental only. It may reasonably be assumed that eventually there will be such reorganization and readjustment of these systems as to result in a larger quantity of water controlled by them being used for irrigation, but until this is accomplished no irrigation extension will be possible other than such as will result from small storage on the numerous lesser streams of the area, of which there are many.

SUMMARY.

More than three quarters of a million acres of agricultural land is the estimate that has been made for the Sierra foothills of northern California of which 45,259 acres are now reported irrigated. In nearly every section included the annual water supply is more than sufficient for irrigating the arable areas found, but difficulties of diversions, uncertainties as to storage possibilities, power and mining development in the foothills themselves, and the certainty of large use of the Sierra streams for irrigation in Sacramento Valley render hazardous any estimate of ultimate irrigation development. No more than reasonable difficulties and complications however seem in the way of future increase in the irrigated area to between 150,000 and 200,000 acres.

SACRAMENTO VALLEY.

This main division of northern California is taken to include (1) Sacramento Valley proper, extending from Red Bluff south to the mouth of the Sacramento at Collinsville, and including both valley floor and adjacent valley plains; (2) broken areas about Redding and along the Sacramento and its upper tributaries other than Pit and McCloud rivers and the streams of the Whitmore foothill area; and (3) the rolling agricultural foothills or upper valley plains bordering the west side of Sacramento Valley south to Cache Creek. This classification puts into the Sacramento Valley division the territory broadly considered as forming Sacramento Valley, with the addition of the scattering bottoms and plains about Redding. Such areas as those at Browns Valley, Rocklin, Orangevale, and Fair Oaks, although not far removed from the valley, are still more properly treated with the Sierra foothills.

DESCRIPTION.

While the detailed study of soils has not been part of the investigations with which this report deals,[1] a brief statement of the varying soil conditions in Sacramento Valley and their topographic occurrence is necessary to an interpretation of present and a general understanding of probable future development under irrigation.

The valley plains—These are the gently undulating, sometimes "hog-wallow," talus lands bordering the eastern edge of the valley and the sometimes more rolling and generally more elevated areas forming the western edge. On the east side, and north of Stoney Creek on the west side, these plains areas are characteristically red or reddish, gravelly, and generally of heavy or compact subsoil, the latter often being a tough hardpan that only dynamiting renders fit for tree growth. Southeast of Red Bluff and northwest of Oroville much of the plains is non-agricultural, except for grazing, because of lava, and in some other sections the presence on the surface of cemented gravel renders them unfit for cultivation. South of Stoney Creek on the west side the so-called plains are themselves either the low eastern ridge of the Coast Range foothills or the washings from them. They are made up of grayish and brownish soils of more uniform character and greater depth. While, as indicated, the Sacramento Valley plains are in places of low, if any, agricultural value, on the whole they constitute a thermal zone of high horticultural value within which the growth of such fruits as oranges, lemons, olives, and almonds has proven very profitable. At present the chief intensive development of the plains lands is in the orchards about Oroville and Corning, and the recent citrus plantings west of Maxwell, noted elsewhere in this report, point the way toward development on the west-side plains that is likely to be limited only by the economic availability of a water supply for irrigation. From Red Bluff south the total area of the plains, including the slightly wooded areas west of Tehama and Arbuckle, scales 346,700 acres on the east side and to 326,300 acres on the west side, the latter not including the higher and steeper of the bare hills, as those west of Norman and Delevan, but otherwise extending to the rocky, broken, and wooded foothills of the Coast Range. The line dividing the valley plains and the foothills is usually not difficult to draw, but in some cases that between the plains and the valley, especially south of Marysville, can only be arbitrarily assumed. Most frequently, however, the plains form a distinct step above the valley floor that is sometimes only slight, although frequently abrupt.

Main valley floor—Below the plains lie the upper lands of the main Sacramento floor. Not all of these are alluvial, which might be considered as limiting real valley land. On the contrary, in addition to the rich alluvium of the Sacramento River bottoms and the immediate bottoms of some of its tributaries, the main valley floor is taken to include the only partly alluvial bottoms of some of the other tributaries and the lower elevations of what a classification strictly according to soil types would include as plains. What might be called the lower plains, because their soils more resemble the gravelly loams of some of the upper plains than the fine silts of the immediate river bottoms, are herein considered part of the main valley floor, because in general they have similar growing and water conditions and require similar methods of agricultural treatment. While the main valley floor contains some soils that are at present of low-producing value, as the ''goose'' lands south of Willows, or difficult to crop, as the heavy black adobes south of Durham, they are as a whole both deep and rich and readily respond to good methods of cropping, tillage, and irrigation. They have been the main source of the enormous yields of grain that brought prosperity to this portion of California for fifty years after farming began in the State, as they will be the main scene of general irrigation farming in Sacramento Valley in the future. Counting approximately 535,000 acres on the east side and 424,500 acres on the west side subject to temporary and intermittent overflow in periods of flood flow in the Sacramento and its main tributaries, and including the overflow lands, the main valley floor scales to 1,346,800 acres between the river and the plains on the east side and to 1,286,200 acres between the river and the plains on the west side—a grand total of 2,633,000 acres. Of these areas of overflow lands, 136,500 acres on the west side and 163,100 acres on the east side are embraced in reclamation districts or are under private reclamation.

---

[1] See special report on physico-geographical and agricultural features of California, by E. W. Hilgard, in report to the superintendent of the census, dated June, 1883 (Government Printing Office, 1884), and U. S. Dept. Agr., Bureau of Soils, soil surveys of Redding, Red Bluff, Colusa, Woodland, Marysville, and Sacramento areas.

The basin and island lands—The main Sacramento Valley floor as above defined is not a continuous body of irrigable land from the plains on the east to the plains on the west, but is interrupted by the basin and other overflow lands on each side of the river below and about the line between Glenn and Colusa counties, and by the islands in the river delta region above Collinsville. From Stoney Creek, the beds of Sacramento River and of the lower portions of its main tributaries are higher than the adjacent lands, and during flood periods of late winter and spring the streams seek relief through five main depressions or basins, namely, Colusa and Yolo basins on the west side of the valley, and Butte, Sutter, and American basins on the east side. The result of the streams thus leaving their channels is the permanent or temporary submergence of 800,000 acres during every considerable flood and of 1,088,000 acres during extraordinary floods,[1] these acreages including the sloughs and side channels at the mouths of both Sacramento and San Joaquin rivers near Collinsville. Of the zone thus within the paths of the overflow, something over 300,000 acres have been wholly or partially reclaimed by dyking, 47,000 acres are classed on the latest topographic map of the valley as salt marshes, and 50,000 acres as fresh water marshes, leaving 691,000 acres, approximately, still subject to occasional flooding. While leveeing costing nearly twenty million dollars has been done along the Sacramento and its main tributaries, no comprehensive or consistent scheme or reclamation has yet been put into effect, the result being frequent disaster, each new reclamation by so much restricting the free escape of the floods to Suisun Bay.[1] Much study has been given to comprehensive plans of leveeing and it is now hoped to carry out a project prepared by the California Débris Commission,[2] that will result in the permanent reclamation of 400,000 acres more swamp land and the permanent protection of the lands now subject to temporary overflow. The latter is to be accomplished by carrying levees along the main sloughs and streams entering the basins, from the by-passes to high ground, and by supplying culverts or pumps to remove the surface water accumulating above the levees. When this project shall have been carried out, the area, principally between levees, that will still remain non-agricultural because of being occupied by stream and flood and other drainage channels will approximate 250,000 acres, and the total area of reclaimed land will approximate 750,000 acres.

---

[1] 62d Congress, 1st Session, House Document No. 81, Reports on the control of floods in the river systems of the Sacramento Valley and the adjacent San Joaquin Valley, California.

CONDITIONS OF DEVELOPMENT IN SACRAMENTO VALLEY.

While the irrigable areas of Sacramento Valley are treated below in some detail, both as to their character and water supply and their present and possible irrigation, some generalizations seem in place here as to the conditions and trend of development in the valley.

Sacramento Valley, although the best watered of any large irrigable area of California, is in the paradoxical situation of being the least irrigated. With a large expanse of land suited to receive water, and in general every condition of soil and climate present that is favorable to intensive and varied culture under irrigation, the total acreage in the valley yet watered is less than is irrigated under a number of single canal systems elsewhere in the State. Many conditions are responsible for this slow growth. In the first place, favorable winter temperatures and a normal rainfall averaging approximately 20 inches, of which more than 80 per cent falls from October to March, has permitted the profitable raising of grains during the winter and spring months without irrigation, and the large land holdings have made such farming both attractive and profitable to those accustomed since the bonanza days to large-scale operations. When fruits and alfalfa have been planted on the alluvial lands of the valley floor, and in some cases even on the plains, they have produced so well without irrigation that many have been led to believe that the expense involved in getting a water supply for irrigation would not be justified by the additional returns irrigation would bring. And even with irrigation accepted as desirable, to obtain a water supply even in a valley so lavishly watered as the Sacramento has involved an effectiveness of association on the part of the landowners that could not be expected in a section so sparsely settled. Knowledge about underground sources, which are closest at hand, has been meager; in fact, outside of the valuable citrus orchards of the south, the economical justification of pumping water for irrigation has only been generally appreciated within the past decade. The value for irrigation of the streams entering the valley from the Sierra or coast ranges has always been understood, but the water laws of the State have so permitted the control of some of them, either by riparian proprietors or appropriators who have neither fully used them nor permitted others to do so, that irrigation development approaching the capacity of such streams has been out of the question. The only water sources in Sacramento Valley whose use has not been retarded by the adverse interests mentioned are the main Sacramento and the Feather and the American, the two larger tributaries of the east side. In the case of the Feather and the American, only the natural slowness of irrigation extension common to Sacramento Valley or the absence of ample low-water flow at points of economical diversion, has held back use. In the case of the Sacramento, the interests of navigation, whose tonnage now aggregates approximately thirty million dollars per year, have stood as an obstacle to irrigation. Although it is doubtful if any proper diversion for irrigation would have been prevented in the interests of navigation, the large additional use of this river will involve not only storage on the Pit to obtain a late summer flow, but also diversion so long and so expensive as to require attractions to capital that apparently do not now exist; or in lieu of that, a strength of organization under the irrigation district law that will be difficult of accomplishment with water available to many from underground or Coast Range sources. Sacramento River lies separated by Colusa and Yolo basins from the higher grounds on the west side below Stoney Creek that are in most need of it, rendering all-gravity or pump and gravity diversions below Central Canal possible only to the lands immediately bordering the river. With storage on the Pit and Feather, water is likely always to be available in the river opposite Colusa and Yolo basins, but the pumping of water across these basins to even the lands of the main valley floor is not yet looked upon as feasible, and probably will not be attempted on a large scale until all underground sources are exhausted and all practicable or economical diversion is effected from Sacramento through or above Central Canal. Nevertheless, if the west-side plains prove as profitable for citrus orchards as the experienced growers who are now starting large plantings on them west of Maxwell believe, and if water is not available from other sources, it is at least conceivable that pumping across the basins to these higher areas will eventually be resorted to, regardless of the fact that such procedure would at present be considered far in advance of economical development.

---

[1] It is estimated in the report of the California Debris Commission that in the flood of January, 1909, the loss in 41 of the 48 reclamation districts then in existence was over $4,500,000, and that the losses throughout the valley due to the floods in 1904, 1907, and 1909 amounted to at least $11,000,000.

[2] For account of reclamation work in Sacramento and San Joaquin valleys, abstracts of reclamation laws, and investigations of State and Federal governments see House Documents 1123 and 1124, 60th Congress, 2d Session; House Documents 76 and 81, 62d Congress, 1st Session; Report to the Commissioner of Public Works of California by Dabney Commission, 1904; Report of Commission of Public Works of California, 1894; and Transactions Commonwealth Club of California, Vol. IV, No. 5. The method of control recommended by the California Débris Commission is the improvement of the present main channel for navigation, with by-passes through Butte, Sutter, and Yolo basins for maximum floods, the by-passes being leveed and covering 78,000 acres of agricultural land, of which 38,000 acres could be partially cultivated. The estimated areas in each basin covered by the by-passes are Butte, 7,570 acres; Sutter, 13,970 acres; and Yolo, 56,545 acres. The estimated cost is $33,000,000, of which it has been recommended that the benefited areas pay one third, the State of California one third, and the Federal Government one third.

WATER SUPPLY OF SACRAMENTO VALLEY.

Although the water supply available to the different unit areas of Sacramento Valley as they have been segregated for treatment is discussed below in connection with such areas, a general summary of known data regarding it seems in place here.

The water resources of Sacramento Valley are the largest in the State, the estimated mean annual run-off of the Sacramento and tributaries being approximately twenty-six million acre-feet. General studies of these resources have been made both in connection with flood control and irrigation, these studies including stream gagings and examinations for reservoir sites on all of the larger streams.[1] The following summary of stream-flow records, taken from the reports of the United States Geological Survey and of the California State Engineering Department, give the mean monthly and annual discharge for the principal streams of the valley for the years down to and including 1910 for which records are available:

Cosumnes River at Michigan Bar	3	524	33	96	371	2,030	1,370	1,370	909	472	161	26	4	7	571	404,000

[1] California State Engineering Department, 1878-85.

An examination of the above summary shows that large as is the water supply tributary to Sacramento Valley, the distribution of run-off is not favorable to direct diversion for irrigation. The main irrigation season is from April to September, the time of its beginning and ending depending on the spring rains and the extent of water available in the late summer and fall. March is the month of maximum run-off, with 19 per cent of the total, but irrigation is not practiced to any considerable extent, and usually not at all, in that month. By June, when heavy irrigation should begin, the run-off falls below the mean for the year. By the end of July it is down to approximately 10,000 cubic feet per second, and throughout August and September it is below that figure. A glance at the table shows that the mean flow of the Sacramento at Collinsville for August and September is 9,570 and 6,810 cubic feet per second, respectively. In 1908, the minimum year covered by the records, the total mean discharge of the measured streams was only 12,500,000 acre-feet, or 49 per cent of the mean of 26,000,000 acre-feet.

STORAGE FOR SACRAMENTO VALLEY.

The lack of available water for irrigation by diversion of natural flow during the summer months shows that storage will be necessary before large irrigation development can take place in Sacramento Valley. The available data regarding storage sites therefore become of prime interest. A summary of these, taken from Fifth Annual Report of the United States Reclamation Service, is inserted below. The sites listed do not include numerous sites already utilized on the Sierra streams, but without those they have estimated amounts annually available to them from their tributary watersheds of 3,390,184 acre-feet.

Summary of data regarding available storage on Sacramento Valley streams.

Name of reservoir.	Description.	Capacity of reservoir basin as surveyed.	Probable amount available annually from watershed.
		Acre-feet.	Acre-feet.
Guenoc	Putah Creek	188,000	80,000
Monticello	Putah Creek	130,000	130,000
Clear Lake	Cache Creek	100,000	100,000
Little Indian Valley	Cache Creek	76,500	50,000
Briscoe	Stony Creek	14,385	14,385
East Park	Stony Creek	26,000	26,000
Mill Site	Stony Creek	43,735	43,735
Iron Canyon	Sacramento River	226,900	226,900
Jess Valley	South Fork Pit River	224,560	----
West Valley	South Fork Pit River	94,579	----
Warm Spring Valley	Pit River	559,015	----
Round Valley	Ash Creek	184,732	----
Big Valley[1]	Pit River	3,196,188	[2]1,000,400
Big Meadows	North Fork Feather River	780,384	780,380
Indian Valley	Indian Creek	688,000	500,000
Concow	North Fork Feather River	10,012	10,012
Butte	North Fork Feather River	107,000	107,000

Mohawk Valley	Middle Fork Feather River	12,626	12,626
Oregon House Valley	North Fork Yuba River	90,823	90,823
Greenwood	American River	65,952	65,952
Totals	----	7,013,578	3,390,184

[1] Big Valley reservoir site is below Jess Valley, West Valley, Warm Spring Valley, and Round Valley reservoir sites.

[2] This estimate includes discharge from Goose Lake drainage.

Where storage capacity is greatly above the supply probably available annually, as is strikingly true in the case of Big Valley, the excess years would enable additional amounts to be carried over to the years of less yield. All of the reservoir sites listed can not be considered as available for irrigation in Sacramento Valley, for their use for that valley must be contingent on both power and irrigation rights on the upper streams, and on such conditions of navigation on Sacramento River as the United States decides to maintain. Power uses adverse to irrigation have not yet been felt on the west-side streams or on the main Sacramento, but they are becoming of importance on the east side. These and other matters relating to water supply are considered in detail in connection with the unit areas of the valley.

SUMMARY OF AGRICULTURAL AND IRRIGATED AREAS.

The following table summarizes the agricultural and irrigated areas of the Sacramento Valley division as they were segregated by county, hydrographic, or other lines for field study:

Summary of agricultural and irrigated areas in Sacramento Valley.

Area.	County or counties.	Valley agricultural land. Acres.	Plains agricultural land. Acres.	Area irrigated. Acres.
Redding	Shasta and Tehama	24,000	55,000	4,080
Happy Valley	Shasta and Tehama		62,000	1,628
West Side:				
Red Bluff-Corning	Tehama	87,000	137,000	4,500
Orland	Glenn	79,000	32,300	5,300
Stoney Creek	Glenn	3,000		2,250
Willows	Glenn	186,000	40,000	6,000
Colusa	Colusa	330,000	39,000	7,875
Woodland	Yolo	400,000	78,000	14,570
Capay Valley	Yolo	10,000		160
Solano	Solano	157,000		2,527
Vaca Valley	Solano	7,000		50
Suisun	Solano	30,000		278
East Side:				
Red Bluff-Vina	Tehama	34,500	29,000	9,600
Chico	Butte	138,000	15,200	800
Glenn-Colusa east side	Glenn and Colusa	82,500		
Feather River	Butte	266,000	86,000	17,190
Sutter Basin	Sutter	158,000		218
Yuba	Yuba	113,000	14,500	4,186
Sacramento-Lincoln	Sutter, Placer and Sacramento	246,000	94,000	225
Sacramento-Galt	Sacramento	236,000	108,000	13,000
Lower Sacramento River islands	Sacramento	72,000		28,272
Scattering, unlocated				791
Totals		2,659,000	790,000	123,500

REDDING AREA.

This includes the scattering areas of alluvial bottom lands along Sacramento River and tributaries between Redding and Red Bluff, aggregating 24,000 acres. It also includes the gravelly plains and lower foothills adjacent to the bottoms, aggregating 55,000 acres. Beginning at the north, the bottom areas are along Churn, Stillwater, and Cow creeks and Sacramento River, east and south of Redding; along Sacramento River and Clear, Cottonwood, and Bear creeks, near Anderson and Cottonwood, and along Sacramento River and lower Paynes Creek, between Anderson and Red Bluff. The creeks east of Redding flow through Stillwater and Millville plains, which are elevated areas of an entirely different character from the narrow creek bottoms. These plains are agriculturally similar to the plains on the east side of Sacramento between Oroville and Chico and thereabouts.

The valley lands in the Redding area are mostly all cultivated. As a rule, irrigation is not practiced, the watered area being only 4,080 acres, lying mainly along Cow Creek and tributaries, Clear Creek, and the lower portion of Paynes Creek near Bend. The first-bottom lands are usually devoted to alfalfa. On some of the lands above the low first bottoms, particularly along Churn Creek and along Sacramento River near Anderson, deciduous fruits predominate. The remaining cultivated lands, generally 50 to 75 feet above the adjacent streams, are still devoted to grain growing. Neither the deciduous fruits nor the grains are irrigated. The lands of the Millville and Stillwater Plains are mostly not cultivated, owing to the impossibility of profitable cropping without irrigation and the absence of an immediately available gravity water supply.

While, aside from on Sacramento River, no stream gagings are available for this territory, there is ample water at hand, if storage is feasible, for irrigating all of the valley land present, either by gravity flow or by pumping. The streams considered above are all perennial and largely within economical reach of the lands to which they are tributary. All of the bottom lands here are not greatly in need of more water, the normal rainfall at Redding, based on a 26-year record, being 36.11 inches and that at Red Bluff being 26.11 inches. With such annual precipitation, in spite of the fact that the summers are dry, deep-rooting crops generally receive ample moisture. The higher lands now devoted to grain growing, however, can and eventually will be made to produce the more valuable crops that irrigation will benefit. Power filings and contemplated development on the streams in this area contribute an element of uncertainty as to their ultimate use for irrigation.

HAPPY VALLEY AREA.

This includes, roughly, 62,000 acres of rolling and elevated plains west of Anderson between Cottonwood and Clear creeks. While known as Happy Valley, the area contains no real valley land and is rather a ridge than a valley. The soil is a gravelly loam underlain at varying depths with hardpan and cut at frequent intervals along the edges of the area with small dry gullies. The section has been crippled by fumes from the copper smelters at Keswick, Coran, and Kennett, both native and planted vegetation having been affected prior to the control of the smelter fumes under court orders. The crops grown are olives, peaches, berries, and vegetables, all mostly irrigated. The present water supply is mainly furnished from North Fork of Cottonwood Creek by Happy Valley Land and Water Company, which at present irrigates 1,578 acres. This company is a coöperative irrigation association that succeeded to the field of the Happy Valley Irrigation District when it failed of organization in the nineties. The water conduit in use is that of an old mining company, whose rights the present company purchased. Another small coöperative association irrigates 50 acres near Ono through Bee Creek Ditch. The areas these two ditches are claimed to be intended ultimately to cover are 20,000 and 300 acres, respectively. Under Bee Creek Ditch, however, a considerably larger area might be irrigated under less wasteful use than now occurs.

Besides North and Middle forks of Cottonwood Creek, Bee Gum, Jerusalem, and Clear creeks are the streams tributary to the Happy Valley area. Clear Creek is now used in summer for irrigating 1,100 acres under the Townsend Flat Ditch, in the Redding Area, but with storage and economical use part of its flow could be made available to Happy Valley. Middle Fork of Cottonwood Creek and the main Cottonwood below the forks could most economically be used on the bottom and low bench lands along the latter stream, but if not used there it is feasible to carry water from the north fork to Happy Valley. Unfortunately no gagings are available for any of these streams. Without storage, but little irrigation increase is likely, but with storage feasible, as to which no data are available, much additional development would be possible. If the expense of diversion from Sacramento River near or above the mouth of the Pit were justified, water for at least all of the lower portion of the area would be available there.

WEST SIDE OF SACRAMENTO VALLEY.

RED BLUFF-CORNING AREA.

This comprises 87,000 acres of valley land and 137,000 acres of plains on the west side of Sacramento River in Tehama County, from Red Bluff south to the Tehama-Glenn County line. Local drainage from the coast range hills yields a considerable run-off of largely torrential character chiefly through Toms, Elder, Red Bank, and Read creeks. No gagings are available for these streams, but none of them carries summer flow of consequence, Toms Creek being the most productive. A reservoir site of 45,000 acre-feet capacity is said to be at hand on Elder Creek and several others are reported, one of which was noted by the Geological Survey.[1] One is claimed to be located near Newville, to which waters of Toms, Grindstone, and Little Stoney creeks are claimed to be tributary, but no reliable data are at hand to demonstrate its value. In general it may be said that pumping from underground sources for the higher valley lands about Corning and from Sacramento River for the Sacramento River bottoms must be the chief means of bringing water to the area. Eventually, however, it would appear that a high-line canal from Sacramento River above Red Bluff will furnish water to the lands on which its use is justified that are not otherwise supplied; also that whatever storage is found feasible on the torrential creeks mentioned will be utilized and the present small use on those streams thereby increased. As some of the higher plains of the Red Bluff-Corning area are of low agricultural value owing to the outcropping of hardpan and the closeness of cemented strata to the surface, the assumption is reasonable that, although nearer to a water supply than the plains farther south, they will be later watered.

---

[1] U. S. Geol. Survey Water Supply and Irrig. Paper No. 86.

Excepting immediately along Sacramento River and west of that river above Tehama, agricultural production is at present relatively not extensive in this area. All of the valley land and most of the plains was, however, originally devoted to grain growing. Later the higher valley lands and some of the plains were set out to orchards, but as the necessity for irrigating these orchards was not appreciated and proper care was not given to them, many were abandoned and now furnish clear proof that successful farming here depends upon water. At present irrigation is mainly in four sections—along Sacramento River near Tehama, where about 1,000 acres of alfalfa are watered; in Richfield colony, where 1,700 acres are irrigated from two ditches of the Corning Irrigation Company; in the Maywood Colony about Corning, where 172 pumping plants supply 1,367 acres; and in the Richfield lands south of Toms Creek and south and east of Richfield, where water is being developed from wells for approximately 5,000 acres, of which only a small portion were irrigated in 1912. Additional irrigation of small areas is found along Toms and the other creeks. When crops are irrigated in this area their yield is highly satisfactory, and in some cases yields have been found profitable without irrigation. The plantings of orange, lemon, olive, and of almond, peach, prune, fig, and other deciduous trees have proven the adaptability of the uplands of this area to fruit growing, and where additional water is brought in, such cultures are likely to predominate.

ORLAND AREA.

This area lies immediatedly south of the Red Bluff-Corning area, extending from the Glenn-Tehama County line to an east and west line 5 miles south of Orland. The area scales to 79,000 acres of valley and 32,300 acres of plains, of which 5,300 acres were reported irrigated in 1911. Of this, 2,600 acres were alfalfa, gardens, and young orchards under the Orland Project, 2,500 acres were sugar beets irrigated by the Sacramento Valley Sugar Company from pumps on Sacramento River, and 200 acres, mostly alfalfa, were irrigated by pumping from the overflow of Stoney Creek. This is the only area north of Woodland area that is fed by a substantial west-side stream, the source here being Stoney Creek. North of Stoney Creek the area comprises an undulating valley or semi-plains area of gravelly loam, while south of it the soil is partially similar and partially more sandy, becoming heavier near Sacramento River. West of Orland the better bare rolling plains begin, extending south through the area.

Stoney Creek has been carefully studied for its storage possibilities by the Reclamation Service, and East Park Reservoir, with a capacity of 26,000 acre-feet, has been built. Other sites surveyed by the Reclamation Service are Briscoe site, with a capacity of 14,385 acre-feet, and Mill site, with a capacity of 43,735 acre-feet.[1] Stoney Creek tributary to these reservoir sites drains 735 square miles of Coast Range hills through a north and south valley lying about twelve miles east of the Sacramento Valley floor. The discharge recorded at the Geological Survey gauging station west of Fruto shows a mean annual flow from 1901 to 1910 of 581,000 acre-feet.[2] Approximately 80 per cent of the total drainage of Stoney Creek lies above Fruto. With complete utilization of mean spring and early summer flow available for direct diversion without storage, approximately 90,000 acre-feet, there is surface water available on a gross duty of 3 acre-feet per acre for approximately 65,000 acres of land, or on a gross duty of 2 acre-feet per acre for over 90,000 acres. This, however, would require diversion capacity greater than is reasonably likely. As at present constructed, Orland Project of the Reclamation Service covers only 14,000 acres. Central Canal of the Sacramento Valley Irrigation Company passes through the Orland area near its eastern edge and might irrigate the land adjacent to it, and additional land will be watered from the pumping plants of the Sacramento Valley Sugar Company at Hamilton. As, in addition to Stoney Creek and Sacramento River, water-bearing gravels underlie much of the Orland area, with usual lifts of only about 20 feet, it is reasonable to assume a water supply for the entire valley area, and so much of the plains as it is later found feasible to cover from Sacramento River. But very little land in this area is subject to overflow. The crops irrigated are all of those common to Sacramento Valley, from citrus fruits to alfalfa. No extensive citrus planting have been made, but several small orchards show adaptability. Most of the present irrigated holdings in Orland Project are small and not yet far advanced, although water has been supplied for some years to some of the lands in the project through two canals from Stoney Creek that were taken over by the Reclamation Service.

STONEY CREEK AREA.

While not properly part of Sacramento Valley, this area is better described here than elsewhere. It consists of scattering pockets of valley land along Stoney Creek before this creek enters Sacramento Valley. The valley has an approximate length from East Park Reservoir of 35 miles with a maximum width of 7 miles at Elk Creek. According to information furnished by the Reclamation Service, 38 diversions from Stoney Creek above the Orland Project headworks, with a total average discharge of 88 cubic feet per second, irrigated 1,550 acres in 1911, of which approximately 950 acres were near Stoney Ford. The crop irrigated is practically all alfalfa. An additional 700 acres are reported irrigated on the tributaries of Stoney Creek. Owing to the roughness of the valley and opportunities for using the water of Stoney Creek in Sacramento Valley, but little irrigation extension can be expected here. The total area of valley land is roughly estimated at 3,000 acres.

[2] U. S. Geol. Survey Water Supply Paper No. 298.

WILLOWS AREA.

This area includes 186,000 acres of valley and 40,000 acres of plains in Glenn County south of the Orland area and north of the Glenn-Colusa County line, not including the small area in Glenn County east of Sacramento River and west of Butte Creek. The valley land in this area has an even slope except in the southern portion, which is at the head of Colusa basin and very flat. In general, the soil in the southern portion is clayey, varying from adobe to silty clay loam; in the northern portion, it is a gravelly or sandy loam. Alkali occurs south of Willows in the central portion. The plains in the area are bare and rolling as in the Orland area, but in contrast with those in the Orland area, they lie entirely west of the valley lands. The slopes closest to the valley only are now cultivated, and none are irrigated.

The local watershed west of Willows area is 220 square miles in extent, but the run-off from this finds its outlet only in numerous minor streams yielding torrential flow and losing themselves in Colusa Basin, and is therefore only available, where available at all, as underground flow. The available water supply is, therefore, Sacramento River or underground sources, with some surplus from Stoney Creek, part of which is now diverted in spring by Central Canal. Extensive pumping development has not yet occurred, but several plants are operating above the line of the Central Canal, and the underground sources, for both valley and plains, can be considered as sure to yield large supplies. The Sacramento Valley Irrigation Project now covers from 90,000 to 100,000 acres, including their land in Colusa area, with ultimate enlargement likely. Approximately 8,000 acres of this were irrigated by the entire system in 1911 and 13,000 acres in 1912. Of this total, about 6,000 acres were in the Willows area. For the land west of Central Canal, water will eventually be brought from Sacramento River by diversion higher than that of the present system, as at Iron Canyon; or possibly from the larger tributaries of the Sacramento above Iron Canyon, the water in the latter case to be carried by expensive construction along the western edge of the flatter plains and pumped from there to the higher areas. Extension of the Orland Project southward or the utilization by other means of the additional storage capacity on Stoney Creek would also accomplish this. It is believed that the entire Willows area, less the acreage now comparatively valueless on account of alkali, can be assumed as irrigable, and that it will ultimately all be irrigated. The portion of this area that is subject to overflow during high water in Sacramento River at present approximates 21,000 acres, but it is assumed that this will eventually be eliminated by adequate dyking.

The irrigated crops now grown in the Willows area comprise all of those common to Sacramento Valley. The irrigation system now in operation is the beginning of large development on the west side. It was a part of this area that Central Irrigation District, organized in 1887 but never in successful operation, was intended to cover, and for which Central Canal, now owned by the Sacramento Valley Irrigation Company, was largely constructed. Here the numerous problems common to west-side development under irrigation will be encountered, including diversion and pumping from Sacramento River, protection of lowlands from overflow, drainage and reclamation of the swamp and alkali areas, control of the surface drainage from the west-side foothills, getting water to the west-side plains, and the other problems connected with the sucessful working out of any large irrigation project.

COLUSA AREA.

This area covers the land in Sacramento Valley in Colusa County west of Sacramento River, scaling to 330,000 acres of valley floor and 39,000 acres of plains, and including the main portion of Colusa Basin. The soil is similar to that of the Willows area, with clay types predominating. A large part of the area is in Colusa Basin and, therefore, in need of drainage and flood protection. Approximately 68,000 acres in this area in Davis, Munson, and No. 108 reclamation districts and under private levees about Grimes have already been dyked and reclaimed. The general plan of flood control for Sacramento River proposed by the California Débris Commission includes a drainage canal from Colusa to Yolo Basin, which is intended eventually to relieve most of the remaining land needing drainage. The amount of land irrigated in the Colusa area in 1912 by the Sacramento Valley Irrigation Company approximated 7,000 acres. The acreage watered by this company is being rapidly increased through extension of Central Canal, which already reaches as far south as Cortina Creek. Irrigation adjacent to Sacramento River and east of the valley trough formed by Colusa Basin is effected by pumping from the river or by admitting water to adjacent land through cuts in the levee, and development of this character will continue and, with complete dyking of the river and the augmenting of its supply by storage above, will eventually cover all of the agricultural land present. Colusa Irrigation Company, the Roberts Ditch Company, and the Reese tract, all near Colusa, were reported as together irrigating 875 acres from Sacramento River when the irrigation census was taken in 1910, with 3,450 acres as the total ultimate area these three small enterprises are to cover.

Aside from Sacramento River there is no stream of consequence tributary to Colusa area. The local drainage on the west approximates 300 square miles, but the run-off from this is largely torrential and not susceptible of being controlled for irrigation. West of Maxwell the first planting of citrus orchards on the rolling west-side plains is under way, with the water supply being pumped over 2 miles and lifted 230 feet from Central Canal, about 45 miles below its intake. The land being so planted is typical of the high rolling plains extending from Stoney Creek to Woodland. The expenditure of about $70 per acre for underground pipe distribution to the plantings and the lifting of water 230 feet, which will be increased next year to 300 feet, is indicative of the faith being shown by experienced irrigators in the value and irrigability of these high areas. Two hundred and fifty acres of citrus trees are out here and being watered during the present year, with an equal acreage being planted elsewhere in the valley by the same interests, the total contemplated planting being 10,000 acres.

WOODLAND AREA.

This area includes the valley and valley plains in Yolo County, extending both north and south of Cache Creek, and aggregating 400,000 acres of the former and 78,000 acres of the latter. The drainage tributary to the area consists of 180 square miles of local watershed in addition to 1,200 square miles of watershed tributary to Cache Creek, of which 500 square miles are above the outlet of Clear Lake. Putah Creek, whose possibilities for use in irrigation are discusssed under the Solano area, borders Woodland area on the south and could be used for irrigating land in the Woodland area if not used elsewhere. In addition Sacramento River borders the area on the east. The run-off from the drainage of the Woodland area, other than Cache Creek, is torrential and without definite channels of importance, so that it can not be considered to any extent for irrigation purposes. The run-off from the Cache Creek watershed is important and has been measured for some years by the Geological Survey, which has maintained stations both at the outlet of Clear Lake, at Lower Lake, and at Yolo. The mean annual run-off at Lower Lake from 1901 to 1910 was 385,000 acre-feet, the minimum being 189,000 acre-feet and the maximum 729,000 acre-feet.[1] The possible storage that has been considered in this drainage is at Clear Lake and in Little Indian Valley.[2] Storage in Clear Lake has been discussed for many years, but without development, owing to property complications along its shores.[3] The mean area of the lake is about 40,000 acres. It has been estimated that from 100,000 to 200,000 acre-feet can be economically stored in this reservoir, the amount depending on property adjustments along the lake shore. The estimated possible storage in Little Indian Valley, which lies on the North Fork of Cache Creek, is 50,000 acre-feet, although the reservoir as surveyed would have a capacity of 76,500 acre-feet. Other storage is possible, according to investigations by the Geological Survey in connection with their survey of Little Indian Valley in 1900, but due to uncertain water supply or expensive construction this has not been seriously considered thus far. If storage were feasible for the entire flow of Cache Creek and tributaries, sufficient water would be available for a very large area. The mean annual run-off at Yolo, which is situated well into the valley floor and below present diversions, has been found by the Geological Survey measurements from 1903 to

---

[1] U. S. Geol. Survey Water Supply Paper No. 298.

[2] U. S. Reclamation Service, 5th Annual Report; U. S. Geol. Survey Water Supply and Irrig. Paper No. 45. For general discussion of irrigation and water-right conditions on Cache Creek see U. S. Dept. Agr., Office Expt. Stas. Bul. 100.

[3] Since this was written, new interests that have purchased the Yolo County Consolidated Canal have been purchasing rights along Clear Lake prior to developing the lake for reservoir purposes.

1910 to be 695,000 acre-feet, the minimum being 250,000 acre-feet and the maximum 1,280,000 acre-feet.[1]

The present reported irrigated area along Cache Creek is 14,570 acres, the supply for most of which is obtained from Cache Creek, the irrigated crops being alfalfa, sugar beets, deciduous and small fruits, and graden truck. Thus far the water supply made available to the area during the summer months has been very limited, owing to the failure on the part of the company controlling the Cache Creek canals to build permanent diversion works. The result has been that irrigation water has sometimes not been available to those under the canals until late in the summer. Within the summer of 1912 the entire irrigation system taking water from this creek has been acquired by new interests who propose to develop the available water supply fully, in connection with power also, farmers under the system having purchased water rights on an acreage basis to the extent of 50,000 acres at the rate of $20 per acre.

That the possibilities for large irrigation development on Cache Creek are great is indicated by the water supply data above cited. The water supply usable directly for irrigation from the creek during the years of even minimum flow is large. If 200,000 acre-feet could be stored in Clear Lake and 50,000 acre-feet in Little Indian Valley, the total area that might be served under a gross duty of 3 acre-feet per acre would exceed 83,000 acres above the present irrigated area. This would not include the extra supply usable by direct diversion during normal years and years of excessive flow, nor the supply available by pumping from underground sources. If only 100,000 acre-feet can be stored in Clear Lake, this increase would be 50,000 acres without considering extra water available in the irrigation season and pumping. If the gross duty could be reduced to 2 acre-feet per acre, the additional irrigable area would exceed 125,000 acres with 200,000 acre-feet stored in Clear Lake, or 75,000 acres with that storage only 100,000 acre-feet. Irrigation by pumping is already beginning to supplement that from canals and will increase considerably in the future. North of Cache Creek the water-bearing gravels appear to occur irregularly, making the supply to be obtained from wells uncertain. In the southern portion of the area the underground supply has been found to be more regular, but thus far no large development by pumping has taken place except directly along the banks of Cache Crek, where some very large pumps have been installed for irrigating sugar beets.

The eastern part of the Woodland area extends into both Colusa and Yolo basins and is therefore subject to overflow. Reclamation of the overflow lands has been carried out in Yolo County in both of these basins, namely in reclamation districts 108 and 787 east of Colusa Basin above Knights Landing, and in Elkhorn and numbers 785, 811, 900, 742, 765, and 307 reclamation districts east of Yolo Basin, some of this, however, being now under way. The main by-pass of the proposed reclamation project of the California Débris Commission traverses the entire portion of Yolo Basin lying in this area, the overflow from all of the basins of the valley being collected into this by-pass between Sacramento and Knights Landing. While approximately 204,000 acres in Woodland area are now subject to permanent or temporary overflow, the non-agricultural area that will be left after completion of the reclamation project, assuming this to approximate the area between the by-pass levees, will be only about 50,000 acres.

---

[1] U. S. Geol. Survey Water Supply Paper No. 298.

Irrigation from Cache Creek began in 1856 when construction was started on the old Moore Ditch, which has been the nucleus of the present canal system on this creek. Little irrigation was practiced, however, prior to 1864. Up to 1881 temporary brush dams were installed each year at the head of Moore Ditch, but in the latter year a more permanent wooden structure was built, this, however, lasting only five years. During this time, in addition to Moore Ditch, the Capay and Adams ditches had been built to cover large areas of grain lands, but these were abandoned as a result of extensive litigation over water rights. By sale and reorganization in 1903, all of the old canals passed into the hands of the Yolo County Consolidated Water Company, but as already indicated, this company did not establish its system on a sufficiently substantial basis to give adequate service. If the new interests that have recently taken over the properties of the Yolo County Consolidated Water Company accomplish maximum development along Cache Creek, agricultural conditions will be very different from those obtaining at present.

CAPAY VALLEY.

This area might properly be classed as part of Woodland area, although it was separated for purposes of investigation because of its isolation. The section included is the narrow valley along Cache Creek from Capay to Rumsey, with a total area of 10,000 acres. Only 160 acres are reported irrigated at present, this being chiefly alfalfa, and receiving most of its water from a small ditch out of Cache Creek near Rumsey. Some citrus fruits are raised in favored localities, although not yet on a commercial scale. The entire area can be supplied with water from Cache Creek either by gravity or pumping from the gravels near the creek bed. At present no extensive pumping is done away from the creek. Underground water is now found between Capay and Guinda at from 15 to 35 feet below the surface with a lift of 15 to 20 feet, these conditions having been noted in domestic wells only. The mean of the rainfall records for Rumsey, Guinda, and Capay shows a normal fall of 22.97 inches, which has been found sufficient for the successful growth of deciduous orchards, to which the upper portion of the valley is now devoted, although here as elsewhere in Sacramento Valley irrigation would be very advantageous in the dry summer months, especially in years of less than normal precipitation. It is believed that ultimately this entire valley will be watered, and the assumption seems reasonable that this could be accomplished without any large diminution of the water supply available to the Woodland area below.

SOLANO AREA.

This area extends from Putah Creek on the north and Sacramento River on the east to swamps and hills on the south and west, and contains 157,000 acres of valley agricultural land, exclusive of Sacramento River islands. In general, the area covered is the northeast part of Solano County, around the towns of Dixon and Elmira. The area reported irrigated in 1910 was 2,527 acres, the irrigated crops being a few tracts of deciduous fruits, alfalfa, and berries, wheat and barley being dry farmed. The local drainage tributary to the area is small and of low run-off yield, but Putah Creek, draining 800 square miles of rolling hills and higher mountains, is tributary to the north. A gaging station has been maintained on this stream at Winters by the Geological Survey since 1905 and the mean of five years' record shows an annual run-off of 515,000 acre-feet, the minimum year having 199,000 acre-feet.[1] In connection with their study of the proposed Sacramento Valley Irrigation Project, the Reclamation Service reported two available reservoir sites on this stream, at Guenoc and at Monticello.[2] The former of these sites has a surveyed capacity of 188,000 acre-feet and an estimated available water supply of 80,000 acre-feet. The Monticello site is near the lower portion of the stream and has a surveyed capacity of 130,000 acre-feet and can be filled annually. Putah Creek has a small summer flow, the discharge in the irrigation season in mean years being 52,000 acre-feet and in the minimum year only 14,300 acre-feet. The full run-off in minimum years could be utilized by the construction of the two reservoirs mentioned, and by using the excess capacity at Guenoc site the years could be partially equalized, giving more than 80,000 acre-feet annually available from the latter source. Discharge records kept by the Geological Survey at this reservoir for 1904–06 showed an excessive annual flow, but it has been estimated by the Reclamation Service that 80,000 acre-feet are annually available. With 130,000 acre-feet which could be stored in Monticello reservoir, 80,000 acre-feet from the Guenoc site, and the 14,300 acre-feet summer flow available in the minimum year of which records are available, the total surface water supply open to this area approximates 264,000 acre-feet, or sufficient for 88,000 acres under a gross duty of 3 acre-feet per acre, or 132,000 acres under a gross duty of 2 acre-feet. At present irrigation development is mainly by pumping from wells near Dixon and a few pumping plants from sumps on Putah Creek. The extent of underground water in this area has not been determined, but at present development is rapid and the supply is apparently sufficient for considerable increase. The present wells are from 90 to 110 feet deep, the water rising to within 15 or 20 feet of the surface. It seems apparent, therefore, that with full utilization of the present storage facilities and full development of underground water, all of the 157,000 acres of valley agricultural land in this area should be considered susceptible of irrigation. Approximately 51,000 acres are within the zone of permanent or temporary overflow, but the reclamation project that has been proposed will, using the same assumptions regarding the non-agricultural area that will remain after reclamation that have been used heretofore, be reduced to about 15,000 acres. Present reclamation in this area is not large and is mainly in Tyer and Sutter islands, between Rio Vista and Courtland.

---

[1] U. S. Geol. Survey Water Supply Paper No. 298.

[2] U. S. Reclamation Service, 5th Annual Report.

VACA VALLEY.

This area comprises all of the well known Vaca Valley, of which Vacaville is the principal center. It is a small, narrow area, chiefly devoted to deciduous fruits, with alfalfa an incidental crop only. About 50 acres are reported irrigated. A 28-year rainfall record at Vacaville shows a normal fall of 27.84 inches. Irrigation is at present locally considered unnecessary. Eventually, however, it would seem as if the limited water supply available would be utilized. The watershed covers 35 square miles and would undoubtedly supply all the water needed for irrigation on the 7,000 acres in the valley proper if the storage were available for its conservation. There are no tributary streams of consequence, and for present purposes at least the only available water supply must be from pumping.

SUISUN AREA.

This area includes the valley agricultural land in southwest Solano County and extends from Laurel Creek on the east to marsh lands on the south and hills on the north and west, containing in all 30,000 acres. This is an evenly-sloping plain of heavy clayey soil. The principal crops now grown are deciduous fruits, with 278 acres reported irrigated in 1909. The area above the valley land is to some extent dry-farmed to grain. No streams of importance enter the area, the local water supply being derived from 100 square miles of bare rolling hills, giving a torrential run-off of generally small volume. The underground water has not been tested for quantity, but unless it is found sufficient it would seem that if irrigation is resorted to here the principal water supply will need to be brought from other than local sources, such as storage water from Putah Creek in the north. The present small area irrigated is mainly from wells, as irrigation for the fruit now raised is considered locally to be unnecessary, the annual rainfall averaging over 20 inches. Extensive irrigation is hardly to be expected here, yet the present small irrigated area will be increased.

EAST SIDE OF SACRAMENTO VALLEY.

RED BLUFF-VINA AREA.

This comprises 34,500 acres of rich valley land and 29,000 acres of plains east of Sacramento River from Red Bluff south to the Tehama-Butte County line. This section has been the location of several of the famous ranches of Sacramento Valley, including the Cone Ranch near Red Bluff, the Los Molinos Ranch opposite Tehama, and the Stanford Ranch at Vina. These large holdings have retarded extensive irrigation, but subdivision and development of small irrigated farms have at last started, and, in 1912, 9,600 acres are being watered. Of this, 260 acres are reported under the flume of the Diamond Match Company, and near Sacramento River southeast of Red Bluff 840 acres are on the Cone Ranch, 5,500 acres in the subdivided Los Molinos holdings, and 3,000 acres on the Stanford Ranch at Vina. In this area are three important perennial creeks, viz., Antelope, Mill, and Deer creeks, and an additional water supply is available from underground sources and from Sacramento River. No gagings are available for the east-side streams except Mill Creek, but eleven measurements made by the Geological Survey on that stream at the Los Molinos dam from August to December, 1909, showed a mean flow of 215 cubic feet per second, 207 cubic feet per second being the minimum. All of this creek is claimed for the Los Molinos holdings. The tributary drainage of Deer Creek is 192 square miles and the entire flow is claimed by the Stanford Ranch. Antelope Creek and tributaries are wholly claimed by the town of Red Bluff and the Cone Ranch. Counting Sacramento River, the water supply is more than ample for this entire area, but the use of the Sacramento here, other than by pumping, would involve the proposed diversion at Iron Cañon. The main crops now grown are the usual grains and irrigated alfalfa, with a large acreage of vines on the Stanford Ranch. In the Los Molinos section and elsewhere after subdivision and the provision of an irrigation supply, alfalfa, deciduous fruits, and the miscellaneous crops common to diversified farming in California will be the ones grown and watered. The portion of this area nearest to Sacramento River is thickly dotted with large oaks and thus exhibits a landscape of natural beauty. The productiveness of the soil here, as well as along almost the entire stretch of Sacramento River bottoms from Red Bluff south to the swamp lands, and a normal annual rainfall varying from 23.39 inches at Chico to 26.11 inches at Red Bluff, have resulted in profitable grain farming and considerable successful deciduous fruit growing without irrigation. The limits of dry farming, however, even in this area, or at least the greatly increased crops and the larger opportunity for diversifying production under irrigation, have established the fact that little material advancement over past conditions is possible without artificial watering. How striking this fact is is amply proven by the contrast observed in the summer of 1912 between the vast unirrigated grain fields of the Cone Ranch, which are as they have been for over fifty years, and the subdivided areas of the Los Molinos holdings immediately adjoining on the south, where twenty new and mostly modern small farm houses were noted within what appeared to be a single square mile.

CHICO AREA.

This covers 138,000 acres of valley and 15,200 acres of valley plains in Butte County, south of the Tehama County line, east of Sacramento River, north of Butte-Glenn County line, and west of Butte Creek and the lava foothills north of Chico. The present irrigated area here is reported as only 800 acres, this being mostly covered from pumps along the streams, chiefly Chico Creek and Sacramento River. The irrigated crops are alfalfa, a few orchards, and hops, the latter on bottom lands northwest of Chico. A considerable portion of this area is subject to overflow from Sacramento River and its tributary creeks, so that drainage is more of a problem on the lower lands than irrigation. According to best available data, 38,000 acres east of Sacramento River and mostly south of Chico are within the boundaries of the lands subject to temporary overflow. A very large proportion of the land of this area is still in the large holdings of the early California farming days. Numerous local streams are tributary to the Chico area, but the main water supply for irrigation must come from underground sources, Sacramento River, and Chico and Butte creeks. The two latter streams drain 230 square miles of the lower Sierra and furnish a considerable run-off, which with storage could be made to supply a substantial part of the agricultural land in the area. No gagings, however, are available for these streams, nor is information at hand as to possible storage. Private water claims on them would complicate their use in irrigation outside of on a few large holdings to which they have been attached. Also, along with other land in Sacramento Valley, on both east and west sides, this area could be covered by high-line diversion from the Sacramento. Bored wells, 40 to 60 feet deep, with lifts of from 20 to 30 feet, located in different parts of the area, are furnishing some irrigation supply. A 39-year rainfall record at Chico shows a normal annual precipitation of 23.39 inches. The richness of the soil, the moist conditions of the lower lands, and the adequacy of the annual rainfall for general farming, here as in the Red Bluff-Vina area has led to the popular conclusion that irrigation would not be beneficial, but recent irrigation development on the Los Molinos lands to the north, and the development of the past decade on the Feather River lands to the south, furnish examples of the benefits of irrigation whose force must be felt at Chico. While the entire valley acreage within this area will never be extensively irrigated because it is in no sense arid, time will demonstrate that the productions on the higher valley lands will be greatly increased with summer water, and when or before these are covered water is sure to be brought to such of the plains areas above as are fertile and arable but which are now used only for grazing. For these the only available extensive supply is Sacramento River.

GLENN-COLUSA EAST-SIDE AREA.

Both Glenn and Colusa counties extend east of Sacramento River to Butte Creek and form a relative narrow area of 82,500 acres of which a considerable portion is subject to overflow. No irrigation is reported for this area. Whatever water supply is needed for irrigation can readily be obtained from underground or from Sacramento River. Throughout the north and south distance a strip from 1 to 4 miles wide consists of marshes, ending in the southern end opposite Colusa in Butte Sink. The higher lands in this area are those bordering Sacramento River and Butte Creek. Of the cultivable area, 21,000 acres are in the large Moulton Reclamation District. The proposed by-pass through Butte Basin bisects the portion of the area in Colusa County, leading thence southwest of Marysville Buttes into Sutter Basin. With Sacramento River, Butte Creek, the streams about Chico, the proposed by-pass adequately leveed, and the lowlands drained, the agricultural area in these eastern portions of Glenn and Colusa counties would approximate 70,000 acres, all irrigable to the extent irrigation is necessary.

FEATHER RIVER AREA.

This is one of the most important irrigation areas in northern California and one of those selected for detailed study of use of water during 1912. Not only is Feather River, which feeds this area, one of the largest of the Sacramento River tributaries, with extensive areas of foothills, plains, and valley subject to its water supply, but within its zone irrigation has developed farther than in any other Sacramento Valley area of equal acreage. Here are combined the complexities of flood-protection, drainage, irrigation, mining, and hydroelectric power in such a way as to typify the larger development problems of Sacramento Valley.

The valley and plains in the Feather River area approximate, respectively, 266,000 and 86,000 acres. Of this, 236,000 acres of valley and 37,000 acres of plains are between Feather River and Butte Creek, and 30,000 acres of valley and 49,000 acres of plains east of Feather River. The portions of the entire area that are subect to temporary overflow, and that are therefore in need of further protection, cover approximately 52,000 acres along Butte Creek on the west and approximately 12,500 acres east of Feather River between Honcut Creek and Marysville, not counting 3,500 acres east of Feather River included below in the Yuba area.

It is stated above that Feather River is one of the larger Sacramento River tributaries. Discharge records kept at Oroville from 1902 to 1910 by the Geological Survey show a mean annual run-off at that point of 6,020,000 acre-feet, the minimum year giving 3,490,000 acre-feet and the maximum 9,340,000 acre-feet.[1] An examination of reservoir sites was made by the Reclamation Service,[1] and several having a total capacity of 1,879,209 acre-feet were found, for which the annual available water supply was estimated as 1,649,385 acre-feet. This storage includes 22 reservoirs with a total capacity of 87,000 acre-feet, which were built for mining purposes, the Big Meadows site on the North Fork of Feather River, controlled now by the Great Western Power Company, and having a surveyed capacity of 780,384 acre-feet,[2] and the Valley site on Indian Creek, where it was estimated 500,000 acre-feet could be stored. With a recourse to stored water in August and September only, and utilization of the quantity directly available in mean years during the irrigation season, April to September, that could be diverted by a total canal capacity of 2,500 cubic feet per second, a total of 915,000 acre-feet would be available or sufficient for 305,000 acres on a gross duty of 3 acre-feet, and for 467,500 acres on a gross duty of 2 acre-feet.[3] With a total canal capacity of 5,000 cubic feet per second, and recourse in mean years to storage in July, August, and September, 610,000 acres could be irrigated on a gross duty of 3 acre-feet per acre, and still leave a surplus of more than one million acre-feet of water in the various reservoirs, provided they were fully developed.

---

[1] U. S. Geol. Survey Water Supply Paper No. 298.

While Feather River carries water in excess of the needs of the land directly tributary to it, so that a supply is available for the section northwest of Butte Creek, if taking it there is found economical, not all of the land to be irrigated in this area will receive its supply from the Feather. Honcut Creek and tributaries, entering the Feather below Oroville, already irrigate a small acreage, and it is possible that storage will be found on them to hold some of the drainage from the tributary watershed. Filings have been made for storage here, but no exact data are at hand as to the presence of reservoir sites, and it is not likely that any of importance are at hand. In the lower portions of the area underground sources are sure to be increasingly drawn on as Feather River power is more fully developed and made available at lower rates for pumpings. The extent of economical use possible from the Feather east of its channel is problematical, the main river branching above Oroville, and its Middle and North forks being difficult of access for the higher lands there, except by pumping. At present, all of the low water flow in South Fork is being utilized on these east-side lands. While some storage is probable here, its extent and economical value are not known. There is little likelihood that enough is available here or on the tributaries of Honcut Creek to cover all of the irrigable land on the east side; consequently, if the entire 79,000 acres of valley and plains is to be irrigated, part of the supply must be carried entirely by gravity or be pumped from the Feather below its forks and then led by gravity to the necessary points of distribution. A part also is likely to be watered by gravity diversion near the head of Butte County Canal. A similar situation exists west of the main Feather. Development now under way will utilize all of the low flow at Oroville and increases above the existing projects must involve both storage and pumping below and probably also above Oroville. That this will ultimately be resorted to both here and on the east side there can be little doubt. The Feather River Canal Company already contemplates two lifts of 20 feet each from its main canal to cover an estimated 17,500 acres. The available hydroelectric power on the Feather and its branches is enormous and is sure to be available, owing to the relatively short transmission necessary, at rates that will justify such use of it. If present development in progress on Big Meadows Reservoir is completed, the low flow of the river above Oroville will be increased, according to the plans of the Great Western Power Company, to 2,500 cubic feet per second. The water thus made available can only be utilized either by pumping, as suggested, or high-line construction of all-gravity canals that is likely to be so much more expensive than part pumping and part gravity diversion as to make the latter the more economical. The announced plans of the great Western Power Company include the use of the water impounded in Big Meadows Reservoir for irrigating 200,000 acres of land below Tehama, but it is not known that plans for such development are beyond the formative stage.

---

[1] U. S. Reclamation Service, 4th and 5th Annual Reports.

[2] It is proposed by the Great Western Power Company, who now control Big Meadows, to construct their dam to a height of 110 feet, which is said will give a capacity of 1,250,000 acre-feet, and cover an area of 40 square miles.

[3] This would assume filling the reservoirs outside of August and September.

Present irrigation in the Feather River area is chiefly under Butte County Canal, which in 1912 watered 14,000 acres, mostly in alfalfa and deciduous fruits, in the valley west of Feather River; under the reservoir and pipe-distribution systems of the Oroville Water Company and the Oro Water, Light, and Power Company, which in 1912 delivered water to 810 acres, principally in olives and citrus fruits, in the vicinity of Thermalito; and under the system of the Palermo Land and Water Company, which in 1912 irrigated 1,880 acres, mostly in oranges, olives, and peaches, in the Palermo Colony. An additional scattering area of about 500 acres is irrigated from Honcut Creek, by pumping from Feather River, and from wells, making the total for the area 17,190 acres. The Butte County Canal is intended ultimately to cover 200,000 acres. An additional large canal is now being constructed by Feather River Canal Company from Feather River about Butte County Canal, this being intended to cover probably 30,000 acres by gravity and an additional area by pumping from the canal to the plains near Tres Vias, as already indicated.

SUTTER BASIN AREA.

This comprises 158,000 acres of valley south of Marysville Buttes and Marysville and between the Feather and Sacramento rivers, in Sutter County, about 16,000 acres of which are in Reclamation District No. 70, 46,000 acres in Reclamation District No. 1, and 6,300 acres under private reclamation. A considerable portion of the area is occupied by Sutter Basin, 31,000 acres of which are classified on the latest topographic map as marsh, and 116,000 acres are subject to overflow.

Bordering Sacramento River, the land is 12 to 15 feet higher than in the trough of Sutter Basin, as it is along the Feather River on the west. The Sutter Basin by-pass proposed by the California Débris Commission traverses the entire length of this area, gathering the overflow from Butte Basin west of Marysville Buttes and delivering it to the Sacramento at the mouth of the Feather. While the higher portions of this area may reasonably be classed as irrigable, it is plain that throughout the area the question of drainage is more serious than that of irrigation. .There is apparently no necessity for bringing gravity water to this section, and the ultimate desire will probably be to entirely confine Feather River within its channel—it is now leveed on its west bank—and to develop by pumping all the water that is necessary for irrigation. Only 218 acres are reported irrigated here now. When the reclamation proposed by the California Débris Commission is completed, the agricultural area here will approximate 130,000 acres.

YUBA AREA.

This covers the land north of Marysville tributary to Yuba River and the area between the Yuba and the Bear east of the Feather, the valley land approximating 113,000 acres and the plains 14,500 acres. Approximately 36,000 acres are subect to overflow, part of which has been included in reclamation districts 784 on the Feather and 817 north of the Bear at Wheatland. The entire area is in Yuba County, and the crops grown are chiefly grains, with some alfalfa along the river bottoms and a considerable area of hops north of Bear River near Wheatland. Much the plains area is now in pasture. Outside of 15,000 to 20,000 acres of hydraulic mining debris between the levees near Marysville, the soils of the area are similar to those of other east-side areas already discussed, varying from sandy and silty loams and clays near the Feather to the red gravelly uplands of the plains. The water supply of the area is Yuba and Bear rivers and underground sources. Discharge records of the United States Geological Survey from 1903 to 1910 show a mean annual flow in the Yuba at Smartsville of 3,220,000 acre-feet, the minimum year giving 1,590,000 acre-feet and the maximum 4,560,000 acre-feet.[1] Storage for power for mining was constructed prior to 1900 to the extent of 112,000 acre-feet,[2] and additional storage has been and is now being built. The Oregon House Valley site on North Fork of Yuba River is reported by the United States Reclamation Service to have a capacity of 90,823 acre-feet, with its full capacity available above it.[3] Lake Spaulding reservoir of the Pacific Gas and Electric Company on South Fork of Yuba is now being increased to hold 91,800 acre feet, which will be carried to the Bear in the course of its use in generating power, as indicated in the discussion of the northern Sierra foothills. It is not possible to figure now on the ultimate place of use of this water or what proportion will be used in the valley and what proportion in the Placer County fruit districts above, but it is evident that the storage now or likely to be available on the Yuba, and the amount of water carried by that stream during the irrigation season, insure eventually a complete supply to the lands of the area needing irrigation and that will not be supplied by pumping and by the minor streams. Carrying water from the Yuba to the Bear is also likely to result eventually in using some of this supply in the area between the Bear and the American.

---

[1] U. S. Geol. Survey Water Supply Paper No. 298.

[2] U. S. Dept. Agr., Office Expt. Stas. Bul. 100.

[3] U. S. Reclamation Service, 5th Annual Report.

Present irrigation in this area covers 3,000 acres under Hallwood Ditch, 640 acres under Stall Ditch, both from the Yuba north of Marysville; and, according to the irrigation census, 546 acres scattering. Hallwood and Stall Ditches have a common diversion in the Yuba at Daguerre Point weir and are together intended ultimately to water 10,000 acres.

SACRAMENTO-LINCOLN AREA.

This comprises 246,000 acres of valley and 94,000 acres of plains south of Bear River, east of Feather and Sacramento rivers, and north of American River, in Sutter, Placer, and Sacramento counties. A feature of this area is American Basin, which extends along the east bank of Sacramento River directly north of Sacramento. The reclamation of this basin and of a strip of land north of it along Feather River and along the south bank of the Bear, aggregating 85,000 acres in reclamation districts Nos. 1000 and 1001, is in progress by the Natomas Consolidated Company. This company proposes, after reclamation is effected, to provide such water as is necessary for irrigation from Feather, American, and Sacramento rivers and to subdivide the land into small farms. The reclamation, and necessary irrigation, of the entire western part of this area being thus provided for by interests sufficiently strong to complete them, the concern of the public is chiefly in the eastern part of the area from American River west of Fair Oaks Colony northward through Antelope, Roseville, Lincoln and Sheridan to Bear River. The land in this section aggregates 215,000 acres, largely plains, that portion generally east of the Southern Pacific Railroad being to a considerable extent of the hog-wallow type and used mainly for pasture. Outside of pumping from underground sources and from Feather and Sacramento rivers for the Natomas lands, if this is resorted to, as seems likely, the water supply tributary to the Sacramento-Lincoln area must mainly be that of the Bear and American rivers. Gaging stations have been maintained by the Geological Survey since 1904 on both of these streams, on the former 8 miles above Wheatland and on the latter at Fair Oaks.[1] The mean annual discharge of the Bear from 1904 to 1910 was 416,000 acre-feet, the minimum being 188,000 acre-feet and the maximum 726,000 acre-feet. For the same period the mean discharge of the American was 3,660,000 acre-feet, with a minimum of 1,450,000 acre-feet and a maximum of 5,710,000 acre-feet. No storage has been found on the Bear by the Geological Survey, but it is understood that private interests have located some sites which they propose to develop in connection with power. Also, as indicated in treating of the Yuba area, water stored on the Yuba is to be turned into the channel of the Bear. If this is done so as to increase the low-water flow of the latter, some water may thus be made available for use south of it on the lands of this area. One enterprise to accomplish this has been projected. Unless water stored on either the Yuba or Bear is available, but little further diversion for irrigation from the Bear can occur because the summer flow of that stream is small, and already the subject of litigation in connection with its use on hop fields about Wheatland.

---

[1] U. S. Geol. Survey Water Supply Paper No. 298.

Considering this area with reference to a possible water supply from the American, conditions are equally problematical, although the American, like the Bear, is capable of irrigating a very large area with storage. Water is now being brought from North Fork of American River to 4,000 acres in the Orangevale and Fair Oaks colonies in the lower Sierra foothills, and those controlling this supply claim ability to cover land in this area as far north and west as Antelope. The North Fork, however, carries only a small summer flow, and extension of use beyond the lands already covered will involve reservoiring. To bring water from the main American will require either diversion some distance above Folsom, in which case lower power interests would have to be considered, or diversion below Folsom by pumping. While either or both of these plans may later be feasible, no data are at hand to indicate which will prove the more economical. The large amount of power that will be developed on the American, however, insures that extra-expensive all-gravity diversion is not likely. Although better sustained than the Bear, American River likewise carries a low summer flow only, the 1904-1910 mean for September being only 330 cubic feet per second. One reservoir site with a capacity of 65,952 acre-feet has been reported by the Reclamation Service at Greenwood, and the Geological Survey has said[1] that storage is feasible on Middle and South forks for power purposes. Full data, however, are lacking for a satisfactory estimate of possibilities on this stream. If sufficient storage can be found for the irrigation of 250,000 acres on a gross duty of 3 acre-feet per acre, only about one half of the total run-off in minimum years would be required. As the land south of American River is probably more easy to cover from that stream than the land north of it, the assumption seems warranted that a larger development from this stream will come there than in the Sacramento-Lincoln area. If complete study shows that but little water will be available from the Bear in summer through storage on that stream or on the Yuba, and if the course of development results in American River being mainly devoted to land south of it, irrigation in the Sacramento-Lincoln area must come largely through all-pump supplies. Some underground water is sure to be developed, as it has been already in scattered localities, and if the higher-priced orchard fruits can be produced successfully on the upper valley and plains lands east of the Natomas reclamation, pumping water eastward from the Feather and the Sacramento would not seem entirely beyond economical procedure for the future. At present, subdivisions are being sold east of Sacramento, as on the Haggin Grant, without a surface water supply, and efforts to obtain underground irrigation water are in some cases successful. The crops now grown in this area are chiefly grains, occasional patches of alfalfa on the moister bottoms, and numerous orchards about Roseville. The irrigated area is reported as only 225 acres. The soils are as a whole typical of Sacramento Valley, varying from deep alluvium near the rivers to cemented gravel in the plains, with much of the loam underlaid with tough hardpan.

---

[1] U. S. Geol. Survey Water Supply Paper No. 271.

SACRAMENTO-GALT AREA.

This covers the section of Sacramento Valley south of American River and east of the Sacramento in Sacramento County, exclusive of the Sacramento River islands. Of a total of 344,000 acres, 236,000 acres are valley proper and 108,000 acres are plains. Of the valley land, 70,000 acres nearest Sacramento, Cosumnes, and Mokelumne rivers are within the area subject to temporary or permanent overflow. A total of approximately 26,000 acres along the east bank of Sacramento River is under full or partial reclamation, or in process of reclamation, in reclamation districts 673, 774, 745, 813, 755, 551, and 554, named in order down the river from Sacramento, and in district 1002, north of Mokelumne River. Another small reclamation district lies in the bend of American River immediately north of Sacramento River. Considering both proven underground and surface sources, the Sacramento-Galt area is one of the best watered sections of Sacramento Valley. Of 1,192 pumping plants reported for Sacramento County by the 1909 irrigation census, nearly all are within the area south of American River, the usual pumping lifts averaging 24 feet, and the number per square mile averaging over 10 on many sections. The flow of American River has already been treated with the area last above mentioned, the mean annual run-off at Fair Oaks having been shown to reach over three and one half million acre-feet. Although the mean summer flow of this river for September is only 330 cubic feet per second, some storage is quite sure to be found available. Cosumnes River, with a mean annual flow from 1907 to 1910 at Michigan Bar of 404,000 acre-feet, traverses the southern part of the area.[1] Comparison of the flow of the Cosumnes during this period with the flow of the Mokelumne for which a longer record is available, would seem to indicate that the mean for 1907-10 was about 15 per cent below that for the period 1904-10. For the period for which a Cosumnes River record is available, the discharge during the maximum year was 656,000 acre-feet and during the minimum year 151,000 acre-feet. Owing to the relatively low altitude of its basin, the summer flow of this stream is not well sustained, the mean discharge during August and September being less than 10 cubic feet per second at the gaging station of the Geological Survey. Therefore the use of this stream for irrigation in other than spring and early summer months depends on the amount of storage that can be developed. In addition to several smaller creeks from the east, a third stream available to this area is Dry Creek, forming part of its southern boundary. Discharge records kept on this stream by the California State Engineering Department from 1878 to 1884[1] showed a mean annual run-off of 172,000 acre-feet, but as this stream is generally dry from July to November, as indicated by the records quoted, its irrigation value also depends upon storage.

---

[1] U. S. Geol. Survey Water Supply Paper No. 298.

Present irrigation development in the Sacramento-Galt area, in addition to that by pumping, is under the systems of the Natomas Consolidated Company, near Folsom and Natoma, and of the Cosumnes Irrigation Company, which was irrigating 300 acres on Cosumnes River bottoms when the irrigation census of 1909 was taken. Irrigation by the Natomas Consolidated Company is through extensions of the old Natomas mining ditch and aggregated 1,400 acres in scattered patches in 1912, irrigation under this ditch being incidental to gold dredging in the American River bottoms. This company, however, has a project involving the watering of 30,000 acres south of American River, the supply for which is to be furnished (1) by the present Natomas Ditch, (2) by a pumping plant at Alder Creek now in course of construction and designed to water 8,000 acres, and (3) by the construction of a reservoir on Deer Creek, a tributary of Cosumnes River, said to be capable of holding a maximum of 35,000 acre-feet. The irrigation by pumping in this area, as already indicated, is of first importance, as it is likely to be for much of the area in the future. Of 11,300 acres irrigated here by that means in 1909, some received its water from streams, including the Sacramento, but most of it was supplied from wells, the motive power in many cases being gasoline engines and windmills. During the past year a power line has been extended into the Cosumnes River bottoms, and the acreage being irrigated by pumping has rapidly increased. With other lines, power is or will be available to the entire area.

Considering the ample water supply available to this area, the entire acreage of agricultural land within it may reasonably be considered as irrigable, with the lower lands most likely to be watered by pumping and the higher lands by gravity from American River. The present crops are mainly grains, alfalfa, hops, orchards, vineyards, and gardens, with the irrigated holdings usually small.

---

[1] Physical Data and Statistics of California, Wm. Ham. Hall, 1886.

LOWER SACRAMENTO RIVER ISLANDS.

These include the principal named island areas south from Merritt Island along Sacramento River and the north and west banks of North Fork of Mokelumne and San Joaquin rivers. These are Merritt and Ryer islands, in Solano County, and Sutter, Grand, Andrus, Tyler, Brannan, Twitchell, and Sherman islands, in Sacramento County. These are all reclaimed delta lands of high fertility, devoted mainly to deciduous fruits, grain, celery, asparagus, beans, onions, potatoes, and alfalfa, all of which, excepting grain, are generally irrigated. According to the 1909 irrigation census, 28,272 acres were receiving irrigation water in that year, the means of application being siphons or pumps from the adjacent sloughs or rivers, the operation also involving drainage by pumps or gravity following irrigations or during high water. The total area of land in this island area scales 72,000 acres.

SUMMARY.

The foregoing discussion of the irrigation resources of Sacramento Valley has been written with the object of indicating in more detail than would have been possible under only general treatment both the present extent of irrigation and something of the trend and possibilities of future development. The extent and general soil and topographic conditions of each of the 22 more or less arbitrarily segregated unit areas have been described, and an effort has been made to present such study of the water supply available to each as, first, would show those interested and not otherwise in possession of the facts what may reasonably be expected in water-crop for each area, and second, would furnish a basis for estimating future growth under irrigation. To perform this last-named task can involve but little more than summarizing estimates based on more costly and more exhaustive surveys made by others in the past, with the advantage to our estimates of the additional investigations of ourselves and others during the past few years.

The tabular summary that preceded the discussion of the unit areas carried a total of 2,659,000 acres of valley and a total of 790,000 acres of plains agricultural land, of which only 123,500 acres are reported irrigated by the irrigation census taken in 1910 and revised for all of the larger and important areas to the season of 1912, inclusive. The grand total of the agricultural areas entered in that summary, viz., 3,449,000 acres, is very much larger than any total heretofore ventured for Sacramento Valley, because there have been included more than three-quarters of a million acres of what are herein classified as plains that have not generally been included as part of this valley. This total figure is, however, offered as what very careful consideration seems to warrant calling the Sacramento Valley area topographically suited to receive water. It is also believed that it is reasonable to consider that water is economically available for such an area to the extent that it is locally at hand or within reach of canals of no greater length than already have been officially projected and approved for this valley. The prediction is not ventured that all of that great area will some day be irrigated. One million acres, roughly, are within the upper line of permanent or temporary overflow, with 800,000 acres naturally covered by every considerable flood, but of which upwards of 300,000 acres are already more or less securely protected by dykes. To dispose of the high floods of Sacramento Valley will involve the wasting between levees along streams or by-passes, so far as can be estimated from available data regarding reclamation plans thus far matured, of some 250,000 acres. Of the remaining overflow land, much is likely never to be irrigated even if levees and drainage successfully reclaim it, unless such land becomes devoted to that highly intensive cultivation common to the older countries where irrigation and fertilization are the basis of agriculture even in the wet lowlands. Even assuming that water is at hand for all of the plains and for the valley floor above the lowlands, a reasonable reduction for roads, towns, and other uncultivated patches would, together with the elimination of the waste lands between the levees, reduce the area to be irrigated to 2,500,000 acres. But it is not likely that either all of the remaining plains or all of the remaining valley floor will artificially be supplied with water, because the certain course of independent and uneconomical development is quite sure not to bring about complete utilization. Nor will all of the plains prove profitable to irrigate with water carried long distances or pumped against high lifts. To attempt to estimate how much less than 2,500,000 acres will eventually be under water does not seem profitable, but it would seem that that area can be considered irrigable in the sense that water is at hand for it and most of it is fit for irrigation.

The first pages of the discussion presented known available data regarding total water supply and storage possibilities. The total mean annual flow of Sacramento River at Red Bluff, which is above Stoney, Cache, and Putah creeks on the west side, and above Antelope, Mill, and Deer creeks, and Feather, Yuba, Bear, and American rivers on the east side, was shown to be 10,400,000 acre-feet. The best estimate available for the mean annual discharge at Collinsville, at the river mouth, is 26,000,000 acre-feet, with a mean low flow at the same point of 7,000 to 8,000 cubic feet per second and a minimum of about 5,500 cubic feet per second. Assuming 7,000 cubic feet per second as necessary for the maintenance of navigation, and that navigation is a proper use even if less economical than irrigation, and assuming further an annual use of 4 acre-feet per acre for each acre now irrigated in Sacramento Valley, approximately 46 per cent of the mean flow past Red Bluff, or 4,800,000 acre-feet of water, now annually go to waste. Counting only Big Valley and Iron Cañon reservoir sites, above Red Bluff, to the extent that water is probably annually at hand to fill them, 1,226,900 acre-feet of this water now wasted might be saved with construction of that storage. Reducing the total mean flow at Collinsville by an amount necessary to supply the excessive quantity of 4 acre-feet per acre annually to each acre now irrigated and a constant flow for navigation of 7,000 cubic feet per second, the present annual waste, outside of excessive use, becomes 20,400,000 acre-feet, which could be reduced to about 17,000,000 acre-feet by the construction of all of the storage considered feasible in the reported studies of the Reclamation Service covering irrigation in Sacramento Valley. By the irrigation of 2,500,000 of the 3,449,000 acres found topographically susceptible to irrigation and the annual use thereon of 3 acre-feet per acre, the mean annual flow of the river that would still be wasted, not considering use for power or for irrigation on the irrigable areas of the Sacramento River drainage outside of Sacramento Valley, would considerably exceed the present mean flow into the valley at Red Bluff. The flow at Red Bluff in 1907–08, however, which is the minimum year of record, was only about 74 per cent of the mean.

SUMMARY FOR NORTHERN CALIFORNIA.

In the introductory pages of this report a tabular summary was inserted showing the acreages of valley, plains, and foothill agricultural lands in northern California of importance from the standpoint of irrigation, together with the acreages irrigated. These areas were arranged according to six irrigation divisions or zones, segregated as to similarity of irrigation and other agricultural conditions rather than strictly according to county or hydrographic lines. The summary showed 4,622,000 acres of valley, 790,000 acres of plains, and 789,000 acres of Sierra foothill agricultural land topographically irrigable within zones of water supply for irrigation. Of this, 483,700 acres was reported irrigated, with 161,850 acres of this in the northeastern plateaus and valleys of Modoc and Lassen counties, 123,800 acres in Sacramento Valley, 99,910 acres in the northcentral mountain valleys of Siskiyou, Trinity, and Shasta counties; 50,600 acres in the Feather River Valleys, 45,250 acres in the Sierra foothills, and 2,290 acres in the northern coastal counties.

With the results of no complete studies of underground waters at hand and gagings lacking for some of the important streams and for nearly all of the smaller ones, it is not feasible to state definitely the quantity of water available for irrigation in northern California. But it can be given in general terms on the basis of the water supply records of the Geological Survey and data as to irrigable land and use given in this report.

Northern coastal counties.—In this division, where it is estimated that not over 100,000 acres will ever be irrigated, although one half million acres of valley agricultural land were found, the water supply is largest where the agricultural areas are smallest and the need for irrigation is least. For instance, Klamath River, which passes for a number of miles through northern Humboldt County, carries a mean annual flow at Keno, Oregon, many miles above, of 1,690,000 acre-feet of water, but only 8,300 acres of agricultural land were found along it in this division, with little irrigation likely even on that. A similar situation in the matter of excess supply and small need for irrigation exists along the other large north-coast streams, viz.: Smith River, in Del Norte County, and Mad and main Eel rivers, in Humboldt County. The water supply is likewise ample for all needed or beneficial use along the smaller streams of Humboldt County, including, principally, Redwood Creek and Van Duzen, Mattole, and South Fork of Eel rivers. Because of the absence of agricultural land or due to humid conditions, very little if any irrigation is possible or needed along the immediate coast of Mendocino, Sonoma, and Marin counties, although Ten-Mile, Noyo, Albion, Navarro, Garcia, Russian, and other rivers carry relatively large quantities of water into the Pacific. In parts of the interior of these and of Lake and Napa counties, however, irrigation would be beneficial in excess of that which will be possible by direct diversion of surface streams, although in all cases the annual precipitation on watersheds adjacent to the agricultural areas would supply all needed irrigation water if it could be stored. In other cases pumping from underground waters or from lakes will give what is needed. The largest supply for irrigation in this division will come from South Fork of Eel River and its branches and from Russian River, because the largest areas of agricultural land that can be benefited by irrigation are within reach of these streams. If 100,000 acres are sometime irrigated in the northern coastal counties, 300,000 acre-feet of water will certainly be all of the water that is needed, and there can be no doubt that that quantity is within reach of land on which it can be beneficially used.

Northcentral mountain valleys.—Absence of stream gagings in this division likewise makes it necessary to use general figures in estimating the water supply at hand for irrigation. The largest agricultural areas are Shasta, Scott, Fall River, and Butte valleys. For Shasta Valley numerous perennial springs aggregating in flow about 150 cubic feet per second and underground sources furnish the most dependable supply, with large quantities of water available for direct diversion from Shasta River and its numerous tributaries in addition to the springs during spring and early summer. Klamath River has also been considered as available here, so that with some storage likely feasible on some of the Shasta River tributaries, water may be considered available for a very much larger area than the 23,800 acres now irrigated. In Scott Valley water is considered at hand if storage is feasible to water all of the 55,500 acres of agricultural land. In Fall River Valley there is a very large surplus, and in Butte Valley there is a deficiency except as underground waters may be developed. In the other areas the water supply varies from none to a sufficiency or an excess. For the entire division it is considered that the present irrigated area of approximately 100,000 acres can eventually be increased possibly to 250,000 acres, requiring, say, 375,000 acre-feet annually.

Northeastern plateaus and valleys.—More stream-flow records are accessible for this division than for the two just mentioned. When Big Valley was considered as a reservoir site by the Reclamation Service, it was estimated that 1,000,000 acre-feet of water would annually be available from Pit River watershed above that site, but this is in excess of the quantity that can be considered available in the sense that it can be used in this division. Counting all agricultural areas along Pit and tributaries reasonably within reach of water down to and including Big Valley, 163,300 acres were found after eliminating West and Jess valleys as probable reservoirs. For this, 500,000 acre-feet of water should be sufficient. For the Great Basin portion of this division, including Surprise and Honey Lake valleys and Madeline Plains, 400,000 acre-feet was estimated as the total water-crop that might be utilized. But considering existing conditions of land and water and that Big and Round valleys may ultimately be used for storage, doubling the present irrigated area of 161,850 acres was taken as the probable limits of future development. Assuming that meadow irrigation will continue on the lower areas in lieu of drainage and the growth of better crops, 600,000 acre-feet may be fairly considered the total quantity of water that will be used for irrigation in this big division of the State.

Feather River valleys.—Here also stream-flow records show with some definiteness the quantity of water present. The mean annual flow of Feather River at Oroville is about 6,000,000 acre-feet, with 1,649,385 acre-feet estimated as annually available above known storage sites. But only a small proportion of this is needed or can be used in the upper areas termed the Feather River valleys, the total valley agricultural land there aggregating only 158,000 acres, and only about 140,000 acres after eliminating one area of excessive elevation. Sierra Valley in this division has a large area and agriculture there is likely to attain a considerable development, but in the other valleys, of which American Valley, about Quincy, with 13,000 acres, is the largest, it does not seem likely that the character of agriculture will materially change owing to the local demand for forage, the relative inaccessibility of most of the areas, and the fixed tastes and customs of the people that will inhabit them. Allowing the usual low duty common to meadow and alfalfa irrigation in a district of ample water supply, 500,000 acre-feet may be fairly assumed as the quantity of water available for irrigation in this division.

Sierra foothills.—Although stream-flow records are available for the larger streams passing through this division, from which irrigation water comes, uncertainties as to the place or the character of future use of these streams makes it impossible to attempt a definite estimate of the water supply that can be called available for irrigation. The topographically irrigable area is estimated as 789,000 acres, with 45,250 acres now reported irrigated. Owing to the roughness and inaccessibility of much of the Sierra region, some land that is irrigable in the sense that it is similar to land there now being irrigated has undoubtedly been overlooked and likewise probably some has been included as irrigable that should have been omitted. But regardless of this, and the further fact that very large water supplies are within reach of some of the areas, no data are at hand that warrant estimating the ultimate area to be irrigated above 200.000 acres. Four hundred thousand acre-feet per annum would supply such an area and allow for heavy transmission losses.

Sacramento valley.—It is of course in this division of northern California that the most extensive and most important irrigation development will take place and the largest quantity of water be used. The summary of conditions there showed that the mean annual flow into Sacramento Valley at Red Bluff has been estimated to be 10,400,000 acre-feet and the mean outflow at Collinsville to be 26,000,000 acre-feet. It also showed approximately 3,400,000 acre-feet of known storage capacity for which water has been estimated to be annually available. Counting valley floor and valley plains approximately 3,500,000 acres of land-surface were found, of which it was inferred that the irrigated area may sometime be increased up to 2,500,000 acres. With necessary storage and navigation continued as at present, it was estimated that even with 2,500,000 acres irrigated, and on a liberal duty of 3 acre-feet per acre, more water would still pass unused into San Francisco Bay than now in mean years enters the valley at Red Bluff. Some of the tributaries entering Sacramento Valley below Red Bluff are of more importance in irrigation than the main Sacramento, because more easy of diversion to the irrigable lands. Stoney, Cache, and Putah creeks on the west side carry a total annual mean of more than 1,750,000 acre-feet with known possible storage on them approximating 544,000 acre-feet, counting full development of Clear Lake. Antelope, Mill, and Deer creeks, and Feather, Yuba, Bear, American, and Cosumnes rivers on the east side have a total annual mean in excess of 13,000,000 acre-feet, more than 2,000,000 acre-feet in known storage. Feather River alone was found to carry in average years enough water to cover all the valley land in Sacramento Valley to a depth of over 2 feet. Even the extensive surface supplies mentioned do not take into consideration the large supplies that now or eventually will come from underground sources. To consider total supplies as above does not, however, indicate the amounts that can be considered as available for irrigation, because minimum rather than mean years govern development and because many considerations may prevent the use of these supplies for irrigation. The total mean flow of Sacramento River at Collinsville during the months April to September, inclusive, approximates, according to the best available data, 16,000,000 acre-feet. Allowing 7,000 cubic feet per second during that period for navigation leaves nearly 13,500,000 acre-feet as an approximation of the supply available in mean years for direct diversion, assuming diverting capacity great enough to handle it. Including the 3,400,000 of known possible storage the total would approximate 17,000,000 acre-feet. But this large supply will never be available for irrigation, and for the purposes of this report 7,500,000 acre-feet may safely be used as the largest figure whose consideration is justified, because it is all that will ever be needed. To furnish this quantity of water in the months of April, May, June, July, August, and September, with an assumed use per acre during those months of 0.2, 0.5, 0.7, 0.7, 0.55, and 0.35 acre-foot per acre, respectively, and also to allow a continuous flow for navigation of 7,000 cubic feet per second, storage would be required in minimum years slightly above the total known to be possible. As the total flow of the entire river system is not equally distributed over the valley in accordance with the distribution of irrigable land, the total flow out of the valley at Collinsville does not, however, conclusively indicate storage necessities above the different areas. But on what appears to be a reasonable assumption with reference to navigation, viz., that it will give way to irrigation when necessary, and with the fact known that large areas in Sacramento Valley will be irrigated from underground sources, it is safe to assume that the total quantity stated as the maximum that will be needed for irrigation, viz., 7,500,000 acre-feet, may be considered available.

IRRIGATION RESOURCES OF CENTRAL CALIFORNIA.

By S. T. HARDING and RALPH D. ROBERTSON,
Irrigation Engineers, Office of Experiment Stations.

INTRODUCTION.

This is the second of a series of three reports on the irrigation resources of California prepared in coöperation between the State Conservation Commission of California and the United States Department of Agriculture. Standards of classification similar to those used in the two other main divisions of the State were adopted in this division, the area reported being that which is susceptible of irrigation if a water supply can be provided. Not all of the areas classed as agricultural will ever be irrigated and much land included in this classification is at present and will continue to be cultivated by dry farming methods. It is intended that the agricultural lands shown on the maps and included in this report shall show the limits within which the future increases in irrigation are likely to take place, without attempting to indicate in which parts of these areas the available water supply will eventually be used, as present knowledge is not sufficient for the making of such a determination. The discussion of the separate areas and the table inserted at the end of this report gives estimates of parts of these total areas which may ultimately be irrigated based on the present knowledge. The areas at present irrigated are from the irrigation census taken in 1910, supplemented by field examinations to determine the changes since that time, actual canvasses of areas being made in the more important sections. Lands which receive water in normal years were classed as irrigated. This includes a large range of irrigation conditions, from the economical methods used in orchards supplied by deep pumping to the wild flooding of pasture.

Of the three parts into which California has been divided for the purposes of these reports, central California contains the largest area of both agricultural and of irrigated land. This division extends from the north line of Contra Costa, San Joaquin, Calaveras, and Alpine counties to a line following the south line of San Luis Obispo county and extending along the crest of the Tehachapi Mountains to Tehachapi and from there across the desert south of Owens Lake perpendicular to the east line of the State. This division combines the essential and typical characteristics of both northern and southern California, as in some parts of it all the products of the other two divisions are successfully grown. All agricultural extremes are encountered from such coast regions as Pajaro Valley, whose generally high rainfall and summer fogs make irrigation hardly necessary, to the arid portions such as southern Kern County and the eastern desert, where irrigation is essential to any crop production, and also from the low overflow areas of the San Joaquin deltas to the higher eastern Sierra valleys.

Four divisions have been made of the portion of the State treated in this report. These are: (1) the coastal valleys, (2) the main San Joaquin Valley, (3) the Sierra foothills above the San Joaquin Valley, and (4) the valleys east of the Sierra. Each of these divisions represents conditions essentially different. In the most northern of the central coastal valleys horticulture predominates, the rainfall being generally of sufficient amount to make fruit raising profitable without irrigation, although the certainty and value of the crops are increased where a water supply can be used. In San Joaquin Valley are found large compact areas of agricultural land bordering large streams, making development in large units the most economical. The agricultural lands in the Sierra foothills consist of generally separate tracts of valley and tillable bench or rolling land of small extent, where climatic conditions make profitable the growth of deciduous or citrus fruits. In the valleys east of the Sierra conditions are typical of the higher mountain areas where forage crops predominate and the methods are more wasteful and crude.

The following table summarizes the agricultural and the irrigated lands in the different divisions:

Summary of agricultural and irrigated areas in central California.

Division.	Valley agricultural land. Acres.	Valley plains. Acres.	Foothill agricultural land. Acres.	Areas irrigated. Acres.
Coastal valleys	887,000			87,000
San Joaquin Valley	6,530,000	1,046,000		1,728,975
Sierra foothills above San Joaquin Valley			777,000	10,620
Lands east of the Sierra	472,000			137,760
Totals	7,889,000	1,046,000	777,000	1,959,355

CENTRAL COASTAL VALLEYS.

The coastal valleys division includes the portion of central California lying west of the Coast Range from Contra Costa to San Luis Obispo counties, inclusive. There are 887,000 acres of agricultural land reported of which 87,000 acres are irrigated. The success attained with agriculture without irrigation, particularly with deciduous fruits, has retarded irrigation until recently. At present the realization that even better returns may be obtained with irrigation is causing much interest to be taken and development to be made in procuring water supplies. As the Coast Range receives but little snow the streams are characterized by torrential run-off, the discharge decreasing soon after the end of the rainy season and in many cases ceasing entirely, sometimes immediately after each storm. This lack of dependability in the surface flow has directed attention to the underground supplies and these are being developed quite rapidly.

The following tabular summary groups the agricultural and the irrigated areas of the central coastal valleys by counties and gives the total and irrigated areas in each:

Summary of agricultural and irrigated areas in central coastal valleys.

Area.	County or counties.	Agricultural land. Acres.	Irrigated land. Acres.
San Ramon Valley	Contra Costa	6,000	10
Bay Shore–Richmond–Stege	Contra Costa	50	50
Lafayette	Contra Costa	1,250	----------
Pacheco–Concord–Martinez	Contra Costa	17,500	20
Ygnacio Valley	Contra Costa	11,800	----------
San Francisco	San Francisco	400	400
East Bay Shore	Alameda	59,500	2,290
Castro Valley	Alameda	2,200	----------
Sunol Valley	Alameda	2,500	----------
Livermore Valley	Alameda	53,000	80
West Bay Shore	San Mateo	33,600	1,230
Pacific Shore	San Mateo	23,400	2,440
Santa Clara Valley	Santa Clara	148,000	42,550
Along Coast, Santa Cruz to Davenport	Santa Cruz	4,300	----------
Along Coast, Santa Cruz to Capitola	Santa Cruz	3,200	520
Pajaro Valley	Santa Cruz	26,000	670
Pajaro Valley	Monterey	6,000	700
Gilroy	Santa Clara	43,000	1,200
Paradise Valley	Santa Clara	3,800	20
Hollister	San Benito	59,500	3,300
Lower Salinas Valley	Monterey	250,000	25,000
Upper Salinas Valley	Monterey and San Luis Obispo	60,000	300
San Antonio Valley	Monterey	18,000	----------
Carmel Valley	Monterey	6,500	----------
San Luis and Los Osos valleys	San Luis Obispo	24,000	80
Chorro Valley	San Luis Obispo	9,000	640
Arroyo Grande and Los Berros valleys	San Luis Obispo	12,000	500
Nipomo Valley	San Luis Obispo	2,500	----------
Totals		887,000	82,000

The irrigation census taken in 1910 gave the following figures on pumping from wells in the above areas in 1909:

Summary of irrigation from wells in the central coast valleys, 1909.

County.	Areas irrigated from pumped wells. Acres.	Areas irrigated from flowing wells. Acres.
Contra Costa	68	
Alameda	1,125	
San Francisco	383	
San Mateo	1,057	
Santa Clara	15,947	7,415
Santa Cruz	247	2
San Benito	1,812	847
Monterey	4,428	
San Luis Obispo	109	18
Totals	25,176	8,282

Electric transmission lines are being extended through the valley and utilized for operating irrigating pumps and a generally rapid increase in the area irrigated from underground sources is to be expected.

The streams of this division, with the exception of Salinas River, which flows parallel to the coast, have small watersheds of short length. The most important are Alameda Creek, Coyote River, Guadaloupe Creek, San Lorenzo, Pajaro, and Salinas rivers, and San Luis Obispo and Arroyo Grande creeks. Alameda Creek is largely controlled for use as a part of San Francisco's water supply and has been measured for that purpose by the Spring Valley Water Company. Various short-time records of the discharge of Salinas River and tributaries, including one for 11 years on Arroyo Seco, are available[1] but otherwise there are no public records of stream discharge.

WESTERN CONTRA COSTA COUNTY.

In the portion of Contra Costa County included in this division only 80 acres were reported as irrigated out of 36,600 acres of irrigable land. This irrigable land does not, however, include all of the land now cultivated, much of the higher areas being farmed to grain. The principal irrigable areas are the San Ramon and Ygnacio valleys and the agricultural lands in the vicinity of Concord. On the valley lands, grain, grapes, and deciduous fruits are the principal crops, the returns from the last two being generally considered satisfactory without irrigation. The nearness of these areas to the cities of San Francisco Bay with their large markets has caused the farms to be of smaller sizes, and the extension of electric railroads will increase this tendency. The local water resources are not extensive, the torrential flow of the creeks requiring storage for use. While underground sources give promise of furnishing some water, the lack of larger gathering grounds will limit the quantity of water which can be obtained. The possibility of growing profitable crops without irrigation and the difficulty in obtaining water supplies make any extensive irrigation development improbable.

---

[1] U. S. Geol. Survey Water Supply Paper No. 300.

ALAMEDA COUNTY.

There are two main divisions of agricultural land reported in Alameda County, that lying along the eastern shore of San Francisco Bay and that along the tributaries of Alameda Creek in Livermore and other valleys. As in Contra Costa County, much land lying above these areas is now used for grain growing.

The area of 59,500 acres along the eastern bay shore is quite well developed agriculturally without irrigation, the land being largely divided into small tracts and intensively cultivated in truck and fruit, only 2,290 acres of which are reported irrigated. Aside from Alameda Creek, whose torrential flow crosses the area, the surface streams are small and inconsequential. Alameda Creek is largely controlled for municipal water supply and its full use for irrigation in this area is not to be expected. The development of ground water is the more probable source of supply for irrigation. Ground water occurs at depths varying from 10 to 60 feet and is now used to a considerable extent for municipal supply and also to some extent for irrigation. In some places ground water is sufficiently near the surface for crops to benefit by subirrigation. Land values are high because of the nearness of large markets and considerable expense for irrigation will be justified, but the returns from present methods are so large that the need of irrigation has not been generally felt. As the possibility of larger yields possible with irrigation is recognized efforts to obtain a water supply will probably be made and any available underground sources used as fully as practicable. The construction of any system supplying water from Sierra streams for the use of the cities lying around San Francisco Bay may affect development by releasing for irrigation water at present used for municipal supply, and also by furnishing some surplus from the Sierra source as contemplated in San Francisco's latest project.

On the Alameda Creek drainage area 57,700 acres are reported as irrigable if a water supply can be secured. This land is very largely farmed in grain and grain hay with some grapes, while sugar beets and hops are successfully raised in a few sections. But 80 acres are reported as irrigated, the diffiiculty of obtaining a water supply having prevented the change from the growing of grain to the more intensive irrigated crops. About 400 square miles of the drainage area tributary to Alameda Creek are available for these areas but the torrential character of this stream makes storage necessary for its use for irrigation. The water supply of this stream has been quite extensively investigated and purchased for use as a municipal supply. Storage on Arroyo Valle and pumping from the lower gravel beds where some artesian flow is now obtained are contemplated. The extensive use of any local supplies for irrigation is not probable, although here, as along the east bay shore, the development of new municipal water supplies for the bay cities may furnish some excess for irrigation.[1]

The nearness of large markets would make profitable the use of any available supplies in the intensive cultivation of garden truck and small fruits.

SAN MATEO COUNTY.

In San Mateo County a total of 57,000 acres of irrigable land are reported of which 3,670 acres are irrigated. This area is quite highly developed, much garden truck being grown for the nearby city markets. Land holdings are small, much of the land along the transportation lines being divided into suburban building sites. Present irrigation supplies are secured largely by pumping from the small creeks, although underground water is found at depths of from 20 to 50 feet and should be sufficient to supply a considerable area, particularly near the various streams. Artesian flow occurs near Redwood at depths of 200 to 300 feet.

On the west shore of San Francisco Bay 1,230 acres of the 33,600 acres of agricultural land reported are irrigated, chiefly in the vicinity of Colma. There are about 65 square miles of local drainage area, exclusive of San Mateo Creek, which is controlled by the Spring Valley Water Company for municipal use. With storage this would supply about one third of the area, although its full use is not probable because of the small size of the various streams. Along the ocean shore, 2,440 acres of agricultural land are irrigated, about two thirds of this being in the vicinity of Half Moon Bay and one third along San Pedro Creek. There are about 200 square miles of tributary drainage area divided between several small creeks which with sufficient storage might supply the area with water. Data on possible storage sites are not available, but full development is not to be expected. The present returns from unirrigated crops are so large that there has been no general demand for irrigation, although its benefits are becoming appreciated. Increase in the irrigated area is to be expected, although more by the use of underground supplies than by storage on the small creeks.

SANTA CLARA VALLEY.

This name is generally applied to the area in Santa Clara County centering around San José and extending south along Coyote Creek to the divide near Morgan Hill. There are 148,000 acres of agricultural land in the valley and lower hills of which 42,550 acres are irrigated more or less completely. This irrigated area is bordered by foothill land which is used to some extent for both fruit and grains, but which has been excluded in this classification as no water supply for irrigation can be considered as available. In this valley, which is noted as a prune and other deciduous fruit center, irrigation was long considered as not increasing the yields and returns in proportion to its cost. In recent years this feeling has rapidly changed until at present practically all of the torrential discharge of the various local creeks is diverted for irrigation in the winter or spring as it may be available, and underground resources are being drawn upon at a rapidly increasing rate, there having been an increase of over 25 per cent in the area irrigated from pumps between 1909 and 1912.

---

[1] Various unpublished reports submitted to Board of Army Engineers in the matter of the application of San Francisco to use Hetch Hetchy Valley as a reservoir.

The soils here vary from sandy loams to black adobe,[1] the latter being found in the lower areas near San Francisco Bay. Owing to the heaviness of the soils and the generally unfavorable drainage conditions the use of these lands bordering San Francisco bay has been confined to the growing of vegetables and forage crops. The soils of the higher valley lands are in many places underlaid by clays which assist in the retention of the water applied in winter irrigation. Alkali occurs in injurious quantity only near the marsh lands, and hardpan does not interfere with agriculture in this area. In the orchards where water supply for irrigation can not be obtained, thorough cultivation and the use of a cover crop during the winter which is plowed under in the spring are used to conserve moisture and soil fertility. As a rule the orchards are owned in small tracts, 15 to 40 acres being usual, and the agricultural methods are thorough and progressive. Los Gatos, Guadalupe, and Campbell creeks and Coyote River are the principal streams, the total drainage area tributary to the valley being about 1,350 square miles. These streams have surface flow during the rainy season only and are generally dry by May. The total run-off and consequently the area irrigated varies with the different years. In 1912, which was a year of low run-off, 8,200 acres received water from Campbell, Los Gatos, and Guadalupe creeks, and in 1909 the census returns gave 9,700 acres irrigated from these same streams. Orchards are the principal crop irrigated, furrows or flooding in basins being the usual methods of application. While it might be feasible in some cases to construct small reservoirs for the storage of part of the discharge of these streams for use in the later season, the use of winter irrigation and ground storage, even although perhaps not as efficient, is cheaper and probably more economical in view of the irregular character of the stream discharge. Artesian flow is obtained north of San José and extending to San Francisco Bay and is used for the irrigation of about 7,000 acres largely of vegetables and alfalfa. In the remaining valley lands underground water occurs at depths varying up to 100 feet, or over in a few cases, the lesser depths being found near the creek beds, although in the sections most largely developed at present, lifts of 40 to 75 feet are the most usual. Near the foothills the depth to water increases and the quantity obtainable decreases so that pumping for irrigation is impracticable.

---

[1] U. S. Dept. Agr., Bureau of Soils, Soil Survey of San José Area.

Owing to the adaptability of this section to the growing and drying of fruit, especially prunes and apricots, a considerable expense for obtaining a water supply for irrigation is warranted and the present rate of increase in pumping plants indicates that the benefits derived from their use are greater than their cost. The underground water should be capable of much additional development, although there are no data available on which an estimate can be based of the total amount which may ultimately be supplied from these sources. The tributary gathering ground exceeds 1,000 square miles on which the annual rainfall varies from 15 inches in the lower valley to over 30 inches in the surrounding ranges. As the surface soils are usually open and the precipitation generally occurs in separate rains of moderate amount, conditions for the absorption of a comparatively large portion of the rainfall are favorable. Water is now being raised from depths which would formerly have been considered impracticable, and a continuation of the development of pumping for lands where soil and other conditions make the growth of orchards profitable is to be expected.

MINOR AREAS IN SANTA CRUZ COUNTY.

SANTA CRUZ TO DAVENPORT.

This area comprises 4,300 acres forming a narrow strip along the Pacific Ocean extending northwesterly about 12 miles from Santa Cruz. Numerous creeks which have their source in the Santa Cruz mountains dissect the area and find their outlet in the ocean. Between the creeks the land is rolling and devoted almost exclusively to the growing of grain and grazing of cattle. No irrigation is reported and, owing to the limited agricultural area and the torrential character of the run-off, it is doubtful if storage would prove feasible.

SANTA CRUZ TO CAPITOLA.

This area comprises 3,200 acres extending easterly from Santa Cruz to Capitola. A few miles back from the ocean the land becomes rolling and gradually merges into the mountains. The soil varies from a sandy loam to a black adobe. The holdings average about 40 acres in extent and the land is valued at $250 to $400 per acre. Deciduous fruits and grapes are grown with a considerable area devoted to truck farming. About 520 acres are irrigated by pumping from streams and wells. The pumping plants are small, deep-well pumps being commonly used, the lift varying from 40 to 60 feet. Increased irrigation development will depend principally upon storage of creek waters but the agricultural area is so small that it is doubtful if the expense of storage reservoirs would be justifiable.

AREAS IN PAJARO RIVER DRAINAGE.

In the Pajaro River drainage are several areas of agricultural land which are more or less continuous. Two of these are in the lower portion known as Pajaro Valley, one lying north of the river in Santa Cruz County, consisting of 26,000 acres of agricultural land of which 670 acres are irrigated, and the other lying south of the river in Monterey County, containing 6,000 acres, of which 700 acres are reported irrigated. In the vicinity of Gilroy, in Santa Clara County, is an area of 46,800 acres, of which 1,220 acres are irrigated, 3,800 acres of the agricultural and 20 acres of the irrigated land being in Paradise Valley. The area extends northwest to the divide into Santa Clara Valley at Morgan Hill. In San Benito County are 59,500 acres in the vicinity of Hollister, of which 8,300 acres are irrigated. These units make a total of 138,300 acres of agricultural land, of which 10,890 acres are now irrigated.

Pajaro River has a total drainage area of about 1,300 square miles, the mean annual rainfall on which varies from 10 inches to 25 inches and probably averages 15 inches. No long-time discharge records are available but present use is much less than the run-off, as even in the dry season water escapes to the ocean. San Benito River is the largest tributary, Llagas, Uvas, and Pacheco creeks being the others of importance. Any extensive use of Pajaro River or its tributaries for irrigation will require storage as its flow is largely torrential because of the lack of drainage areas extending to regions of snow. Some sites for storage are known. One reservoir on San Benito River to contain 4,500 acre-feet is being built, and other sites probably exist which it will be practicable to utilize if the demand for their use arises. Underground water conditions are also generally favorable, particularly in those portions lying near any of the streams. About one half of the present irrigated area is supplied with water by pumping from this source. Artesian flow is also encountered in various places.

PAJARO VALLEY.

The lower portion, the so-called Pajaro Valley, is best known agriculturally for its apples and berries, more apples being shipped from this section than from any other in California. Owing to the generally high rainfall, 23.7 inches annually at Watsonville, irrigation of mature orchards is not considered to increase the yields in proportion to its cost. Such irrigation as is practiced consists mainly of the pumping of water for use on berries and other inter-crops in young orchards. As the returns from unirrigated orchards are satisfactory to their owners no large increase in irrigation is to be expected. During the summer dry season, the cool fogs are of much benefit in reducing evaporation and possible sunburn in the apples. During the winter the hills which practically surround the valley aid in protecting the orchards from sudden temperature changes. Sugar beets and potatoes are also important crops in the lower lands, while on the higher valley lands and hills barley and oats are extensively grown. Up to the present time irrigation has been confined to portions of the more productive alluvial bottom lands the total area of which is about 18,000 acres. The soils are variable, loams and sandy loams comprising the largest acreage with the heavier soils found in the lower portions.[1] The only use of Pajaro River for irrigation has been by pumping, the lifts being from 20 to 40 feet. Browns Creek is tributary to the river, entering from the north in this area. In the lower bottoms sufficient water for irrigation can be obtained from wells at lifts of approximately 20 to 50 feet. At various times much of the present orchard land has been irrigated, the prevailing practice being to plant the various types of berries such as blackberries, raspberries, loganberries, or strawberries, and in some cases sugar beets between the rows of young trees and to irrigate the whole until the orchards come into bearing. Irrigation of mature orchards is not practiced and as the soils adapted to apples are quite largely used for them, at present the areas available for irrigation are not extensive. Some alfalfa is irrigated but land is generally considered too valuable to be used for this crop. It is not probable that irrigation will ever be developed in this valley even to the extent of the available water supply, as the lands for which a water supply can most readily be obtained are those on which its use is the least needed. While the irrigation of the higher lands would be of benefit the cost has up to the present prevented any attempts being made to provide a water supply for them.

Pajaro River flows through a narrow valley above Chittenden which widens above the mouth of San Benito River, forming the valley extending from Gilroy for 12 miles northwest in Santa Clara County along Llagas and Uvas creeks, and also the area in San Benito County along the San Benito River and around Hollister.

GILROY AREA.

In Santa Clara County a mixed development is found, part of the land being in small holdings and intensively cultivated in fruit and other crops similarly to Santa Clara Valley to the north, and part still remaining in the large grants, of which but slight agricultural use is made. The rainfall is higher than in the areas farther north, being about 19 inches at Gilroy. Llagas Creek, the largest stream, drains about 80 square miles of low hills, the run-off being torrential and irregular. The land along upper Llagas Creek is known as Paradise Valley and is a highly developed prune district. Present irrigation is mainly by pumping, the under flow of Llagas Creek being available in the lower lands along its course. Artesian flow can be secured southeast of Gilroy in the lower areas. With the subdivision of the large holdings and the continued increase in irrigation from pumps, this area should reach development similar to the Santa Clara Valley.

---

[1] U. S. Dept. Agr., Bureau of Soils. Soil Survey of Pajaro Valley, Cal.

HOLLISTER AREA.

In San Benito County irrigation is more largely practiced, San Benito River being the main source of supply. Dairying is more prominent here than the fruit industries. A ridge of low hills separates the valley along the lower San Benito River from the main areas around Hollister, forming the San Juan Valley, containing about 10,000 acres which are largely planted in orchards. North of Hollister is an alkaline area of swamp and overflow land of which 10,000 acres are as yet unreclaimed and have been excluded from the classifications of this report. Owing to the smaller rainfall, the mean annual precipitation at Hollister being about 12 inches, irrigation is more necessary than in the valleys to the north. About 3,300 acres are irrigated by gravity canals from San Benito River, winter flooding methods being used. The increase of this acreage is contemplated, as through storage the discharge of San Benito River can be made to serve much more land, the total drainage area being about 700 square miles. Underground water in sufficient quantities for pumping is obtainable under the valley land, becoming scarce near the foothills. This is also used at present as well as the artesian flow which can be obtained in the northern portion. Increase in irrigation, both from streams and from ground water, can be expected in this area.

SUMMARY.

Of the total of 138,300 acres of agricultural land reported in the various areas in the Pajaro River drainage, but 10,890 acres are irrigated at present. The success which has been attained without irrigation has caused less interest to be taken in procuring a water supply than would have otherwise been the case. This also renders uncertain any estimate of the area which may eventually be irrigated although it is probable that all accessible sources of water supply will ultimately be utilized. Sufficient records are not available on which an estimate of the total water supply can be based. The irregular and torrential character of the discharge of the surface streams will limit their use largely to winter flooding as being cheaper than storage in reservoirs. The greatest dependence will be placed upon underground supplies and these should be capable of irrigating several times the present area. Their use is more probable in the Gilroy and Hollister sections as rainfall and climatic conditions are less favorable there than in the lower Pajaro Valley. The drainage area is about the same size and the general precipitation probably but little more than one half that of the Santa Clara Valley, in which over 40,000 acres are irrigated without having nearly reached the practicable limit, and the ultimate irrigation of nearly 40,000 acres should not be impracticable in the Pajaro River drainage.

SALINAS VALLEY.

Salinas Valley comprises the largest area of agricultural land in the coast division. It extends in a southeasterly direction from the bay of Monterey to its head in San Luis Obispo County, a distance of about 100 miles. The valley is separated from the Pacific Ocean on the southwest by the Santa Lucia Range and on the northeast is separated from San Joaquin Valley by the Mt. Diablo Range. Salinas River forms the main drainage artery and with its tributaries drains 4,780 square miles.

For the purpose of this report Salinas Valley is divided into lower Salinas Valley and upper Salinas Valley, the division line being taken a few miles southeast of King City, where the valley becomes a narrow strip along the river.

LOWER SALINAS VALLEY.

Lower Salinas Valley lies entirely in Monterey County, is from 7 to 9 miles wide, and comprises 250,000 acres. This area is about equally divided between uplands or plains bordering the foothills and bottom or valley lands. The uplands are devoted almost exclusively to the growing of grain and consist of a soil of loose, coarse texture. The bottom lands are of various grades of sand, sandy loam, and adobe.[1]

The discharge of Salinas River near Salinas was measured from January, 1900, to July, 1901.[2] Comparison of this with the records on Arroyo Seco covering 11 years indicate the probable total mean annual discharge of the Salinas to be between 500,000 and 600,000 acre-feet. The annual discharge in dry years is about 200,000 acre-feet. The run-off is not largely used, mainly because of its torrential character to the depth of the stream bed below much of the land, and the success in growing large acreage of grain without irrigation.

There are six canals diverting water from the Salinas River and its main tributaries, the Aroyo Seco and San Lorenzo River, irrigating about 11,500 acres of land. Four of these canals are controlled by a local sugar company. Extension of irrigation from gravity supply must depend principally upon the storage of flood waters. The United States Geological Survey has made surveys and reported on the storage of Salinas River.[3] Two sites on the Arroyo Seco were favorably reported upon, having a combined capacity of 41,367 acre-feet. It is estimated that the reservoirs can be filled once in dry years and twice in ordinary years, being emptied once for winter irrigation. On San Lorenzo Creek, the Mathews reservoir was surveyed and the water supply estimated to be 4,000 acre-feet in dry years and 12,000 acre-feet in ordinary years. Assuming the duty of water to be 2 acre-feet per acre per season, these reservoirs if built would provide water in ordinary years for 46,000 acres. Other reservoir sites were examined but under present conditions the cost of storage was not considered justifiable, although ultimately the sites may be used.

---

[1] U. S. Dept. Agr., Bureau of Soils, Soil Survey of Lower Salinas Valley.

[2] U. S. Geol. Survey Water Supply Paper No. 300.

[3] U. S. Geol. Survey Water Supply and Irrig. Paper No. 89.

Irrigation by pumping from wells or from stream channels has increased in large proportions in the last few years. In 1912 there were over 100 pumping plants in the valley providing water for 13,500 acres of land, or nearly three times the area reported by the census of 1909. Underground waters in sufficient amounts for use in irrigation underlie most of the lower valley lands at lifts varying from 20 to 40 feet. With the advent of electric power in the valley in 1912 and the more general attention given to irrigation, pumping will be the source of much future development.

The principal crops irrigated are beets and alfalfa, and in the adobe soils one heavy irrigation applied in the winter has been found sufficient. Grain constitutes one of the staple crops of the valley and is grown without irrigation. As in many parts of California where wheat and barley have been grown successively for many years, the yield has decreased and the soil depleted. Attention is now being diverted to other crop pursuits, chief of which are sugar beets, alfalfa, and potatoes. One serious handicap to agricultural development has been the vast single land holdings. In the drainage basin of Salinas River 51 ranchos covered an area of 570,000 acres. A large number of these ranchos remain intact but they are gradually being subdivided into small tracts. Another factor that has retarded irrigation development in Salinas Valley is that until recently the rainfall was considered sufficient for agriculture. The average annual precipitation at Salinas covering a period of thirty years is 14.71 inches, with seasonal fluctuations of from 5 to 20 inches. This wide variation and uncertainty in the rainfall has impressed upon the residents of the valley the need of irrigation. The winds have a marked influence upon the climate. During the dry season trade winds enter the valley from Monterey Bay which give way in the winter to winds from the southeast frequently accompanied by rain. Fogs which prevail during the dry season also play an important part in the climate by conserving soil moisture and checking evaporation. With the subdivision of the large holdings and the increase in the acreage being planted to sugar beets, potatoes and alfalfa, instead of grain, the outlook for irrigation extension is promising.

UPPER SALINAS VALLEY.

Upper Salinas Valley extends from King City to about 9 miles southeast of Santa Margarita, comprising 60,000 acres. Above King City the valley narrows to about a mile in width, and from Wunpost to San Miguel the river flows in a deep, wide canyon. The valley widens again southeast of Paso Robles and from that point to its head is cut by numerous channels and broken rolling hills.

The upper Salinas Valley is devoted almost exclusively to the growing of grain and the live stock industry. Small fields of alfalfa are irrigated along the bottom lands by pumping from the stream or from wells. The area irrigated in 1912 was 300 acres.

Near Paso Robles artesian water has recently been struck at a depth of 325 feet and present indications are that sufficient water can be obtained for irrigating most of the available agricultural area in that vicinity.

SAN ANTONIO VALLEY.

This is a mountain valley with an average elevation of 1,000 feet lying west of the upper Salinas Valley and comprises about 18,000 acres. It is an old settled section, being founded a century ago, and is devoted almost exclusively to the growing of grain and raising of cattle. The valley floor is covered with scattered oak timber. giving a park-like appearance. San Antonio River has been explored for reservoir sites, but the only one found available is a considerable distance below the body of agricultural land. Sufficient water for stock and domestic purposes is obtained from wells at depths ranging from 25 to 40 feet. There are not enough wells on which to base an opinion as to underground water conditions, but it is not probable any extensive irrigation will take place in this valley from underground sources.

CARMEL VALLEY.

This is a small coast valley drained by the Carmel River which enters Carmel Bay about 4 miles below Monterey. The valley is from $\frac{1}{4}$ to $\frac{1}{2}$ mile in width and the area embraced in this report covers about 6,500 acres. The soil ranges from a sandy loam to a black adobe along the river bottoms. The waters of Carmel River are utilized by Pacific Grove and Monterey for municipal purposes. Alfalfa is grown in the bottom lands with subirrigation and aside from this no irrigation is practiced. Dairying and stock raising form the principal industries, although deciduous fruits are successfully grown. Irrigation development in this area will probably follow along lines of pumping from underground sources.

SAN LUIS OBISPO COUNTY AREAS.

SAN LUIS AND LOS OSOS VALLEYS.

These are two adjoining valleys in San Luis Obispo County comprising 24,000 acres. In common with other Coast Range valleys they have a northwest-southeast trend. The average elevation is 200 feet. The combined length of the valleys is about 20 miles and the width varies from 1 to 4 miles.

Drainage is afforded San Luis Valley by San Luis Obispo and Pismo creeks, which find an outlet in the Pacific Ocean. Los Osos Valley is drained by Los Osos Creek, which flows northwesterly into Morro

Bay. The average annual rainfall at San Luis Obispo covering a period of ten years is 21 inches. Grain and beans are the principal crops grown, with an increasing acreage of alfalfa, and more attention is being given to irrigation. There are only a few small pumping plants, irrigating about 80 acres. Where wells can be sunk in old stream channels water can be obtained in sufficient quantities to irrigate small areas.

CHORRO VALLEY.

This valley comprises 9,000 acres of agricultural land which lies along Chorro Creek northwesterly to Morro Bay. Conditions are similar to those in Los Osos Valley except that more irrigation is practiced, the area watered being 640 acres. This consists of small fields of alfalfa found along the creek bottoms. Irrigation may be extended by building small storage reservoirs on creeks that enter the valley, but it is doubtful if the area that could be irrigated would justify the expense.

ARROYO GRANDE AREA.

This includes Arroyo Grande and Los Berros valleys, together comprising 12,000 acres. The valleys are located in the southwestern portion of San Luis Obispo County and except along the Pacific are surrounded by broad rolling hills or mesas. Drainage is afforded by Arroyo Grande, Los Berros, and Pismo creeks, which find their outlet in the Pacific. Arroyo Grande Valley is highly developed and widely known for its seed farms. Other important crops are beans, sugar beets, grain and walnuts. Land is held in small tracts averaging 40 acres. Arroyo Grande Creek is the source of supply for three irrigation companies which irrigate about 500 acres. Generally one or two heavy irrigations in the winter are sufficient for beets or alfalfa, which are the only crops irrigated. Storage will be necessary for any further extension. Pumping from wells has not been resorted to and the data on underground supply is therefore meagre. Water is obtained from 15 to 30 feet below the surface and should afford sufficient supply for irrigating small areas.

NIPOMO VALLEY.

Nipomo Valley is separated from Los Berros Valley by a low range of hills and extends southwesterly from the summit to Santa Maria River, a distance of about 6 miles. South of Nipomo the valley is dissected by several small streams or arroyos and is broken by low rolling hills. The area comprises 2,500 acres and no irrigation is reported. The valley is devoid of timber and brush and the soil is mostly black adobe. Almost the entire area is farmed to grain in large holdings with an increasing acreage in beans. The depth to water in a few domestic wells in the valley ranges from 25 to 40 feet and sufficient water is afforded for stock and domestic purposes. From the scant information on the underground supply, it seems possible that small areas can be reclaimed by pumping from wells.

SUMMARY.

The agricultural land in the various areas reported in the central coastal valleys totals 887,000 acres, of which 82,000 acres are irrigated. The water supply for about two thirds of this is obtained from surface streams either by gravity diversion or by pumping. Owing to the torrential character of all streams draining the coast range in central California complete seasonal irrigation from surface supplies as practiced in the other divisions is not possible without storage. As yet the benefits of irrigation have not been sufficiently recognized to make feasible large projects which alone could afford expensive storage, the opportunities for which are not generally favorable. The largest existing canal system irrigates less than 4,000 acres.

Underground waters, either pumped or flowing, now supply over one third of the present irrigated area and their use is increasing at a more rapid rate than that of the surface streams. No detailed study has been made of the amounts which can be secured from the groundwaters without depleting the supply, but it is certain that present development takes much less than can be safely withdrawn. The greater reliability of groundwater supplies as contrasted with the variable flow of the local streams, and the better adaptability of the former to the small units in which the more intensively cultivated irrigated land is usually held, make their full use the most natural development.

In practically all agricultural areas in this division or at least in as large parts of them as the available water resources can supply, crops of high returns can be grown so that a comparatively large expense for irrigation may be justified. That the benefits are becoming appreciated is evident from the increase in use of pumping plants and other sources that is now taking place, although in many portions the profits without irrigation are sufficient to satisfy the landowners, particularly those with large holdings. It is this ability to produce crops without irrigation that makes difficult any forecast of future development. It is not improbable that 70,000 acres will be irrigated in Santa Clara Valley and 40,000 in the Pajaro River drainage. It has been estimated that 65,000 acres[1] can be supplied with water from surface resources in Salinas Valley and with full use of underground waters this figure may be exceeded.

Including the other smaller areas it is reasonable to expect that a total of 200,000 acres will eventually be irrigated and even this acreage may be exceeded. Were these coast valleys located where irrigation is a necessity it is certain that their water resources would be made to serve greater areas than these. The ultimate irrigation of 200,000 acres is an increase of less than one and one half times the present development. Until recently it has been maintained in many of these valleys that irrigation was neither a necessity nor a benefit, and much additional use of the available water supply both in small pumping units and by canals and storage is to be expected.

---

[1] U. S. Geol. Survey Water Supply and Irrig. Paper No. 89.

SAN JOAQUIN VALLEY.

The division which consists of the main San Joaquin Valley is the largest irrigated section in the State, both in the area at present irrigated and in its prospective development. It includes the lands lying in the main valley floor and in the adjacent more or less rolling plains through which the valley trough blends into the higher Sierra foothills. On the western side of the valley, because of unfavorable topographic and climatic conditions, no land is classed as irrigable and agricultural except that lying in the valley, the division between valley and hills generally being distinct. On the eastern side there is an area of varying width which differs both from the valley lands and from the distinctly foothill lands. This has been classed as a plains area and is tabulated separately from the valley land in the summaries. In the northern portion of the valley this plains area, which lies mainly above present canal systems, is used principally for grain raising, while in some of the southern sections, as in the vicinity of Porterville, citrus fruit growing has been developed, although in the southern portion, because of the lack of an adequate water supply, the plains in the main have been but little used for agriculture. Lying higher than the plains area and in scattered valleys and flats are agricultural lands which, because of their differences both topographic and climatic, have been classed as a separate division and are discussed under the head of Sierra foothills. The division between these areas is not distinct in many cases and their classification is partially a matter of personal judgment.

Summary of agricultural and irrigated areas in San Joaquin Valley.

Area.	County or counties.	Valley lands.		Plains lands.	
		Total agricultural. Acres.	Area irrigated. Acres.	Total agricultural. Acres.	Area irrigated. Acres.
Areas south of San Joaquin River:					
Southern Kern County	Kern	390,000	115,500	228,000	570
Wasco	Kern	368,000	32,500	81,000	--------
Lands along Buena Vista Slough	Kern	116,000	40,000	----------	--------

---

[1] Not included in total.

[2] Includes all land holding water rights from Crocker-Huffman canal; only 19,500 acres actually received water in 1912.

[3] Not segregated from valley irrigated areas.

The separate areas of San Joaquin Valley division as they have been segregated for study are shown in the accompanying table, the total being 7,576,000 acres, of which 6,530,000 acres are in the valley floor and 1,046,000 acres in the plains area. Of this total, 1,728,975 acres are at present irrigated. The remaining 5,847,025 acres represent the area in which future increases in irrigation will take place. While this land is susceptible of irrigation from some source of water supply, excepting part of the west side, its total extent exceeds that which from present information the water resources can be considered as capable of supplying. The discharge of the main streams has been measured sufficiently to enable their possibilities to be estimated with some definiteness, but the underground resources while known to be large can not be similarly stated.

Records of the discharge of the streams in San Joaquin Valley generally cover longer periods than those for Sacramento Valley, but examinations for storage sites are not available for as much of the drainage area. More use is made of the run-off than in the Sacramento Valley, the natural flow of several streams being quite fully diverted during most of the year. The failure to store the flood waters is due to some extent to the present legal uncertainties which would be involved in any storage which would conflict with riparian right. The year 1897-98 showed the lowest discharge of any of the years covered by stream records. Only the larger rivers were measured during that year, although the five gaged furnished about two thirds of the total discharge. By estimating the others by comparison with other low years, the total mean annual discharge in the year of lowest discharge appears to have been about 4,740 cubic feet per second for the streams from San Joaquin River north, and 2,060 cubic feet per second for Kings River and those to the south, a total of 6,800 cubic feet per second, equivalent to about 4,900,000 acre-feet for the year. This is only 40 per cent of the flow during years of average run-off. The total mean annual run-off as shown by accompanying table has been approximately 12,000,000 acre-feet, or sufficient, if its complete use were practicable, to irrigate 4,000,000 acres at a duty of 3 acre-feet per acre. While the seasonal use of water has been quite largely adapted to the variations in stream-flow, the utilization of the entire run-off would require more storage capacity to equalize both seasonal and annual variations in flow than can be provided at practical costs. The following table gives the general data regarding the mean discharge of the measured streams:

Table showing drainage areas in sqaure miles and mean monthly and annual flow in cubic feet per second of streams in San Joaquin Valley.

The underground water is one of the greatest water resources of San Joaquin Valley and its use is increasing rapidly, although considering the valley as a whole its development is just beginning. In some localities, as around Stockton and Fresno, pumping plants are now numerous, but further increase in the areas irrigated by this means is being made. Artesian flow can be secured in many parts of the lower valley floor and is used to some extent for irrigation, as at Corcoran and Semitropic. Parts of the west-side areas are the only portion where at least some underground water can not be obtained for irrigation. The ultimate development of 5,000 cubic feet per second from underground sources has been estimated as possible in the entire valley.[1]

The following table shows the area irrigated from wells as given by the census of 1909, and also the area at present irrigated from this source, as determined from the field work for this report, the increase for the three years having averaged 30 per cent per year:

Irrigation from underground waters, San Joaquin Valley, 1909.

County.	Census of irrigation for 1909.			Area reported irrigated in 1912. Acres.
	Area irrigated by pumping plants. Acres.	Area irrigated from flowing wells. Acres.	Total irrigated from ground waters. Acres.	
Kern	4,290	2,097	6,387	12,240
Tulare	31,286	6,656	37,942	75,320

Merced	2,002	262	2,264	4,680
Stanislaus	5	------------	5	440
San Joaquin	8,642	------------	8,642	11,380
Totals	70,659	20,415	91,074	171,760

The necessity of irrigation was early appreciated in the southern end of San Joaquin Valley, and farming without it has been attempted but little south of Kings River. The benefits resulting from the use of water have become so well recognized that but little land is dry-farmed except from the lack of an available water supply. In the northern portion of the valley the higher rainfall and more retentive soils in some localities have made profitable the raising of grain, as well as some orchards and vineyards, without irrigation, but these sections are also rapidly coming to an appreciation of the benefits of irrigation.

The climate shows a quite regular variation from the north to the south, the rainfall decreasing from 15.4 inches at Stockton to less than 5 inches at Bakersfield, and the mean annual temperature increasing from 59 degrees at Stockton to 66 degrees at Bakersfield.

A great variety of crops can be grown successfully, which allows the individual farmer much choice in this regard. Forage crops, both alfalfa and wild hay, are extensively raised for both dairy and stock feeding. All classes of deciduous fruits and grapes are produced in large quantities. Sugar beets are successfully grown to a small extent, which will increase, although the present profits from other crops requiring less labor tend to retard increase in beet acreage. But little grain is irrigated except on the large holdings. In the delta lands truck gardening and potato raising predominate. The different sections tend to specialize in one or two crops for which their local conditions may be best adapted, such as sweet potatoes in parts of Merced County.

---

[1] U. S. Geol. Survey Water Supply Paper No. 222.

The soils of the valley in general are sandy, sand and sandy loams predominating. Heavier soils occur in some places, as on the overflow lands along the rivers. A considerable proportion, particularly on the east side, is underlaid with hardpan of varying thickness occurring at varying depths. However, this hardpan seriously interferes with cultivation in but a few scattered localities. Over-irrigation and lack of drainage, have rendered much land unproductive from alkali, but proper cultivation and reclamation can restore much of this land to productivity.

The topography shows but few features. Kings River and Los Gatos Creek have built their deltas across the valley, forming a ridge which prevents the waters of the streams south of Kings River reaching the lower valley except upon the occasion of rare floods. The excess flow of the southern streams forms Tulare Lake, which fluctuates in size and depth with the varying stream discharges. San Joaquin River flows west to the trough of the valley and then turns north to form the main drainage for the lower valley portion. Several tributaries, some of large size, join the San Joaquin from the east, but the meager run-off of the west side rarely reaches the river. The streams from the Sierra have generally built deltas into the valley, over which they can be distributed for irrigation without serious difficulties, Kings River being particularly easy to divert. This feature has been of material assistance in the development of irrigation.

San Joaquin Valley has also been prominent in the water-right litigation of the State, the riparian doctrine being first defined in the case of *Lux* vs. *Haggin,* on the Kern River. The large cost and unsatisfactory outcome of the various lawsuits have caused many combinations of interests and compromises over water rights to be made outside of the courts. Much of the water used is now diverted under such compromise divisions, which have proved of more value and stability than any procurable in the courts alone. These conditions have also made it easier for single owners to obtain control of large areas.

KERN RIVER AREAS.

The Kern River area includes the main portions of Kern River delta and the valley and plains lands lying across the southern end of the valley, containing 390,000 acres of valley and 228,000 acres of plains, of which 115,500 and 570 acres, respectively, are reported as irrigated, although the irrigated acreage varies in different years, depending on the discharge of the river. The area is dependent almost entirely for its surface water supply upon the flow of Kern River. The mean annual rainfall, 4.81 inches at Bakersfield, is the lowest, and the mean annual temperature, 66.4 degrees, the highest of any portion of the valley. The area served by the canals lies mainly on the delta which Kern River has built into the valley and north of this delta. Canals now built cover 300,000 acres, of which a total of 176,000 acres are reported irrigated at present, including the areas along Buena Vista Slough and in the valley north of the delta. Considerable information regarding the Kern River and its canals has been published.[1] Records of stream flow cover twenty-three years, the measuring station being at what is known as the first point of measurement, about 5 miles above Bakersfield.[2] The mean annual discharge for the full period has been 1,060 cubic feet per second, equal to 770,000 acre-feet per year, the maximum annual discharge being approximately 2.5 times the mean, and the three years with lowest discharge occurring in succession, 1898 to 1900, averaging 40 per cent of the mean annual flow. The highest stages occur in May and June, the lowest from Steptember to November.

Except Kern River, there are no surface sources of water supply of importance in this area. The other streams have no high mountain drainage areas and as a result have an irregular and small run-off. Discharge records have been published for Caliente Creek,[3] the mean annual run-off for six years being estimated as 138,000 acre-feet. Around the southern end of the valley are a few very small streams, such as El Tejon and San Emidio creeks, which yield a small run-off, San Emidio Creek now being used to irrigate about 100 acres of oranges and deciduous fruits.

The pumping of underground water is being rapidly extended and in many localities gives promise of supplying quite large areas. An area lying around and east of Buena Vista Lake has artesian flow, 112 wells measured in 1905 yielding a total of 70 to 75 cubic feet per second.[4] In 1909, 2,097 acres were irrigated from flowing wells in Kern County. Deep seepage in the Kern River delta is considered to be the origin of this supply. The 114 pumping plants reported by the last census in Kern County irrigated 4,290 acres in 1909. The area reported irrigated from wells in 1912 is 12,240 acres, the construction of electric power lines having stimulated the use of this type of power. The lift varies with the location, being about 30 feet or less in the Kern River delta. The plains area which extends in a broad belt around the southern end of the valley must depend for any future water supply upon pumping from wells or storage of the flow of minor creeks. The pumping of underground water with lifts of from 130 to 230 feet is being practiced near Edison, citrus trees having been planted there. The greater portion of this plains area has not been prospected for pumping supplies, so that any estimate of the extent to which these can be developed for irrigation is impossible. Owing to the small catchment areas and the low rainfall, only limited supplies can be expected, particularly across the southern end of the valley. On the eastern portion nearer Kern River it is possible that considerable quantities can be secured without permanently lowering the ground water, as, where the soil and temperature conditions will permit of the growth of the high-valued citrus fruits, higher lifts will become feasible.

[4] U. S. Geol. Survey Water Supply Paper No. 222.

Kern River was among the earliest streams used for irrigation in California, and at present utilization of this stream is the most complete of any of the streams in San Joaquin Valley. The legal conflict over water between the upper and lower divertors first brought the riparian doctrine into force in determining water rights in this State, the only working settlement reached, however, being a compromise agreement made outside the courts. The canals are divided into two general groups, the upper consisting of sixteen systems operating under supervision of the Kern County Land Company, and the lower, or Miller & Lux, or Kern Valley Water Company canals, of which storage in Buena Vista Lake is a main feature.[1] The flow of Kern River is measured for division at two points 23 miles apart and an agreement now in force between the two groups provides for division of the water in 6-months periods. The agreement also permits the use of Buena Vista Lake as a reservoir, defines its boundaries, and prohibits storage in Kern Lake. Under this agreement the total flow of the river is quite fully used, diversions continuing throughout the year. Buena Vista Lake has a storage capacity of about 130,000 acre-feet and is used to supply areas to the north. The only water reaching Tulare Lake from Kern River is minor waste from canals flowing to the north or at very high stages through the Goose Lake channel. Kern Island Canal has the prior right to 300 cubic feet per second. This canal and the East Side, Farmers, Stine, Buena Vista, and James canals are the principal canals on the south side of Kern delta, the Beardsley, Calloway, and Pioneer being the chief ones on the north side. The first two cover also lands in the valley outside of the delta proper. All of these are operated under the control of the Kern County Land Company. The Miller & Lux systems consist of an inlet canal into Buena Vista Lake and outlet canals for the irrigation of the Miller & Lux holdings in the valley trough. The various Kern County Land Company systems are reported as irrigating 126,000 acres at present and the Miller & Lux as irrigating 50,000 acres.

Alfalfa and grain are the chief irrigated crops, irrigation in large checks being the rule, the land being owned mainly in extensive holdings where intensive methods are not followed. Much alfalfa is pastured instead of being cut. The soils are variable, sand and peat loams being found on the delta, with considerable clay in the southern and western portion. More or less alkali is found throughout, and also considerable unclaimed swamp land. The water table varies from 2 to 4 feet below the surface near Bakersfield to 12 feet in portions of the delta. The methods and seasonal use of water have been quite largely adapted to the variable flow of the river, water being used whenever obtainable, in some instances pumping also being used to supplement the low flow. The average duty varies from 2.5 to 3 acre-feet per acre.

---

[1] U. S. Dept. Agr., Office Expt. Sta. Bul. 239.

Future increase in irrigation in the Kern River area will depend on storage in the upper drainage of Kern River and increased pumping from underground sources. Development from summer surface flow can be considered practically at its limit under present methods. A reconnaissance[1] for storage was made by the Geological Survey and feasible sites for the storage of 153,000 acre-feet reported. The extent to which underground sources can be developed can not be determined from present knowledge. A considerable supply should be obtainable in the Kern River delta under the canals, as the seepage loss is large, measurements indicating a loss in the Kern River alone. between the two points of measurement mentioned above, of 20 per cent of the total flow.

Under present conditions of large holdings any changes in the use of the present gravity supply are not probable, as the present methods are adapted to the cheap and quick irrigation of large areas. Division into smaller holdings would result more in increased production than in an increase in the area which would be supplied from Kern River, and development is more probable along the lines of increased crop returns than in increased acreage.

WASCO AREA.

This area extends from the 7th Standard Parallel south to the north line of Kern County, and from the foothills on the east to the lower lands in the valley trough on the west. This includes 368,000 acres of valley land and 81,000 acres of plains, of which 32,500 acres of valley land are irrigated at present, partly from extension of Kern River canals and partly from underground supplies. Poso Creek is the only stream entering this area for which run-off measurements are available, six years' records giving an estimated mean annual run-off of 92,000 acre-feet.[2] This run-off is torrential and irregular, storage being necessary for its use. The Poso Irrigation District intended to use this stream for the irrigation of 40,000 acres and did considerable construction work, but the project was abandoned. The Calloway and Lerdo canals diverting from Kern River extend to the vicinity of Wasco, alfalfa and grain being the principal crops irrigated. Artesian flow is used to some extent for irrigation in the vicinity of Semitropic, some wells formerly flowing now being pumped, however. Underground water occurs at depths of from 30 to 40 feet near Wasco, above the canals the increase in depths becoming about 100 feet at Famosa and being too great under the plains land to justify pumping for any crops except citrus fruits, which as yet have not been grown here. The underground water under the valley should be capable of supplying several times the present area and development is rapidly taking place, both individually and under the colony system. Owing to the small run-off the locally tributary drainage area, large underground supplies are not to be expected under most of the plains area here, although some pumping for citrus fruits may eventually be done. The existing canals from Kern River at present are constructed to cover more land than they can supply, and increase in the irrigated area will depend almost entirely upon the use of underground supplies, chiefly in the lower valley lands.

---

[1] U. S. Geol. Survey Water Supply and Irrig. Paper No. 46.

[2] California Engineering Dept., 1878–84, Physical Data and Statistics, Wm. Ham. Hall, State Engineer, 1886.

BUENA VISTA SLOUGH AREA.

This area comprises the lower valley lands lying along Buena Vista Slough, extending from Buena Vista Lake to the north line of Kern County, consisting of 116,000 acres, of which 40,000 are reported irrigated. The water supply is obtained from storage in Buena Vista Lake, which has a capacity of 130,000 acre-feet and an approximate area of 25,000 acres. The stored water is used for irrigating wild grass, alfalfa, and grain on the large holdings of Miller & Lux. This area was originally a swamp which has been reclaimed, and owing to the heaviness of the soil, drainage after irrigation is required, the drainage water being used again for the irrigation of other lands, general conditions being similar to those in the lower Kern River delta. Artesian flow is found in the northern part of the area and pumping supplies occur generally at small lifts. The area at present irrigated from surface supplies is not susceptible of much increase, but the underground supplies should make feasible the irrigation of more land. Owing to the heavy soils and slow drainage of this area, any changes in present agricultural methods are not to be expected, particularly under the present large land holdings, and colonization is not probable, as the lands seem best adapted for large-scale crop production.

ANTELOPE PLAINS AREA.

This area includes the valley land lying west of the valley trough in Kern County and includes 304,000 acres of which none are reported irrigated. The Coast Range furnishes practically no run-off to the area, the creeks being very torrential, their small discharge sinking before the valley is reached. Both the quantity and the quality of underground supplies are unsatisfactory, the water obtained being strongly alkaline. The irrigation of this area can not be considered possible under any present standards or knowledge, as any surface water supply would have to come from the east side, where in Kern County the present land under constructed systems exceeds that for which water can be supplied.

WHITE AND DEER CREEKS AREA.

This area lies on the east side of the valley in southern Tulare County, extending west to the lower valley around Tulare Lake, and includes 181,000 acres of valley and 37,000 acres of plains land. There are 9,030 acres reported irrigated at present, 7,600 acres being in the valley and 1,430 acres in the plains, underground water being the source for about two thirds of this. White and Deer creeks, the only tributary streams, have small torrential flow, the discharge of which measured from 1878 to 1884 by the California Engineering Department,[1] the estimated mean annual run-off being 29,000 acre-feet for White Creek and 35,000 acre-feet for Deer Creek. The flow of these streams rarely reaches Tulare Lake and generally fails to reach the San Joaquin Valley as late as July. Underground water is being developed at many places, flowing wells occurring west of the main line of the Southern Pacific and pumped supplies at lifts varying from 20 to 30 feet in the lower valley, increasing to from 60 to 120 feet on the plains. Considerable development for citrus fruits is taking place in the higher portions of the valley lands and in the plains. The groves, while largely too young for bearing at present, are expected to produce as well as those near Porterville. The soil is a reddish sandy loam, with hardpan occurring in parts of the plains at depths of 6 feet or less. In the lower valley the groundwater rises close to the surface and much of the soil is impregnated with alkali. Much of the non-irrigated land is dry-farmed to grain. The most important canal system is the Deer Creek Consolidated Ditch, which irrigates 3,000 acres near Saucelito, alfalfa being the principal crop irrigated. The water is used when available but owing to the small amount and irregular character of the surface flow, no increase in the area at present irrigated by this means is probable, even through storage. While more expensive because of the higher lifts, irrigation from pumps in the plains area will be carried to the limit of the water supply, because of the valuable citrus fruits which can be grown here. As this area is not supplied by any local streams of size the underground supply is more easily exhausted, replenishment coming from the slow general percolation in all directions from the porous delta of the larger streams.[2] While the local additions are probably similarly small in the lower valley lands, the underground water is considered to be a direct part of the general body underlying the whole valley and therefore not so easily exhausted, although present use is reducing the artesian flow in some cases and making pumping necessary on wells formerly flowing. While the limited extent of the water supply will probably prevent the irrigation of more than a small part of this area, such use of underground supplies as may be feasible will allow a material increase in the area at present irrigated.

[2] U. S. Geol. Survey Water Supply Paper No. 222.

PORTERVILLE, OR TULE RIVER AREA.

This area includes the land adjacent to Tule River and that traversed by its sloughs, extending from the White and Deer creeks area on the south to the Kaweah River area on the north. It includes 162,000 acres of valley and 37,500 acres of plains, of which 38,010 and 11,710 acres, respectively, are reported irrigated, although the area watered varies from year to year with the supply available. In years of high stream-flow, 14,000 acres additional are irrigated near Tulare Lake. In the plains of this and the Kaweah areas are included some land which, while it might properly be classed with the foothills, yet is not sufficient in total area to make its separate treatment advisable. This foothill land consists of a narrow strip now generally planted to citrus fruits, extending for a short distance up the steep slopes, and of a few small coves of cultivable land which are more or less separate from the main valley.

Two discharge records have been kept on the Tule River, which is the only stream of importance in this area.[1] The later records of the Geological Survey at their station above the mouth of South Fork show a mean annual run-off of 204 cubic feet per second, equivalent to 148,000 acre-feet per year. South Fork furnishes but little water during the summer season. The discharge in the maximum year of record was 2.3 times that of the mean, and in two years in succession the run-off was slightly less than one half the mean. The largest flow occurs from March to May, August and September being the minimum months. It is only during flood periods in the spring that any water reaches Tulare Lake. Not considering waste, the natural flow is as fully utilized already as is practicable, and any increase in acreage must come from storage, opportunities for which are not considered favorable. Underground supplies have been largely developed in the upper portions where valuable citrus fruits can be grown, the lifts being from 75 to 100 feet and more. The extent to which the underground supplies can be drawn upon in these higher portions is uncertain, some lowering of the ground water level having already been observed in places. Artesian flow can be obtained in the lower portions of the Tule River delta. The pumping lifts in the intermediate lands are comparatively low and the quantities of water available are greater than on the higher areas.

Irrigation from the Tule River began in 1859 and development has been characterized by the building of many canals, some of considerable length, others being short openings in the stream-bank for flooding purposes. The total area covered is approximately 200,000 acres, the systems of the Tule River and Tipton irrigation districts having been abandoned because of difficulties over water rights and the building of other canals for larger areas than could be supplied. There has been much litigation over water rights without reaching any general settlement. In 1909, 37 of the lower riparian owners secured the right to 400 cubic feet per second during the twenty-two days from March 19th to April 10th as against all the upper ditches.[1] This amount is considered sufficient because the valley land along the river is ordinarily irrigated but once each season. The alfalfa on the upper lands is irrigated two or three times as water is available. On the plains and higher valley lands where frost conditions permit, as in the vicinity of Porterville, citrus fruits are the predominating crop, the early ripening of oranges giving them an advantage in the market. The soils in this portion vary from clay loams to clay adobe.[2]

---

[1] 1878-84, California Engineering Dept., Physical Data and Statistics, Wm. Ham. Hall, State Engineer, 1886; 1901-10, U. S. Geol. Survey Water Supply Paper No. 299.

Future development in this area will be by increased returns from the use of surface flow by reduction of present losses in canals, and by increasing the area irrigated from wells, which source may be made to supply several times the acreage in the valley lands at present receiving water from underground sources. Changes from the present forage crops to the more profitable ones also are probable in the lower portions of this area.

KAWEAH RIVER AREA.

The Kaweah River area lies between the Tule and Kings River areas and includes the lands tributary to the Kaweah River, extending west to the lower lands irrigated from underground sources around Tulare Lake. There are 342,000 acres of valley land and 37,000 acres of plains, of which 117,550 and 7,130 acres, respectively, are reported irrigated. The area irrigated in the lower lands varies quite largely from year to year, depending on the available water supply. There are 20,000 acres additional irrigated from the Kaweah River by the Settlers Ditch in the lower Kings River area.

Kaweah River is characterized by the several channels into which it tends to divide after reaching the valley. Except as controlled for irrigation purposes, these channels are shifting and the maintenance of diversions has required much work and expense. Stream records for two periods are available, 1878–84 by the California Engineering Department and 1903–10 by the United States Geological Survey,[3] the average of all records giving a mean annual run-off of 736 cubic feet per second, equal to 533,000 acre-feet per year. In the maximum year the discharge was approximately twice and in the minimum year one half of the mean. May and June are usually the months of highest flow, averaging about 1,900 cubic feet per second, during September to November the discharge often falling below a monthly mean of 100 cubic feet per second. During the high stages excess water reaches Tulare Lake; during low stages all the flow not diverted by the upper canals sinks in the river bed. The natural flow is now as fully diverted for direct use as can be expected. The storage of flood waters would add to the low flow and increase both the acreage and value of the crops raised. Although no data regarding possible storage sites are available, some development should be practicable.

[3] California Engineering Dept., Physical Data and Statistics, 1886; U. S. Geol. Survey, Water Supply Paper No. 299.

Irrigation with water from underground sources is increasing. Artesian strata underlie the lower portions of the delta, while in the higher valley and plains the lift varies from 50 to 100 feet. Seepage from Kaweah River and its canals furnishes the underground supply, which occurs in the largest quantities near the river and in the least quantities in the portions of the plains more distant from the large streams. In the southern part of the plains in this area, near Lindsay, the groundwater level fluctuates with the seasonal use due to the many plants operating. Much of the land in the Kaweah delta, around Visalia, receives water by subirrigation. In some cases the rise of ground water has been sufficient to injure crops, but no comprehensive plans for drainage have as yet received consideration. Irrigation from the Kaweah River began in 1853. The floods of 1861–62 made material changes in the main channels and were the beginning of complications which have resulted in many conflicts, it being estimated that $400,000 has been spent in litigation.[1] There are two associations of canal companies composed of those diverting from the St. Johns River and Kaweah River channels, respectively, which operate under an agreement as to the division of the water. When the flow exceeds 80 cubic feet per second it is divided between the two channels; when less than this amount it all passes into the Kaweah channel.

Sixty-two canals divert from the Kaweah River, although only 107,000 acres of the 203,000 acres covered by constructed systems are irrigated. Practically all are managed coöperatively, the individuals receiving water in proportion to the stock held in the ditch companies. Tulare Irrigation District includes 37,400 acres, of which about 12,000 acres are usually irrigated, the area varying in different years with the water supply available. The history of this district, which was organized in 1889, has consisted largely of dissension and difficulties with the holders of the $500,000 of district bonds. These were purchased for $273,000 in 1903, a single levy of 36 per cent of the assessed valuation being made for the purpose. Conditions are improving and irrigation can be expected to increase.

In the lower lands alfalfa and pasturage are the crops of largest acreage, dairying being an important industry. In the vicinity of Exeter and Lindsay, in the so-called thermal belt, extending along the higher valley and plains lands, citrus fruits are successfully grown. The soils and land values of this area are similar to those in the Porterville, or Tule River, area. Any increase in the irrigated areas will come from a better use of present diversions through improvements in canal systems and administration, the rise of ground water in some localities indicating over use. Increase in pumping in the lower delta lands should serve the twofold purpose of increasing the irrigated area as well as tending to partially relieve the poor drainage conditions. The use of storage, if feasible, and extension of the use of underground supplies will permit of the production of higher valued crops requiring late season irrigation, which at present cannot be sure of securing water when needed. While the sub-surface resources may be at present developed quite fully in the higher areas, much opportunity for their use in the valley lands yet remains and it is here that the largest increase in irrigated acreage is to be expected.

[1] U. S. Dept. Agr., Office Expt. Stas. Bul. 239.

TULARE LAKE AREA.

The Tulare Lake area consists of the lower land lying on the south and west of Tulare Lake in Kings and Tulare counties, watered partially by Kaweah and Tule river water but more largely by underground supplies. There are 240,000 acres of agricultural land exclusive of the present area of Tulare Lake, of which 58,420 acres are reported irrigated, 14,000 being supplied from the Tule River during times of flood flow and 44,420 from artesian flow and pumped wells. The area of the lake as partially controlled by levees at present is 133,000 acres. When at an elevation of 220 feet, at which stage it overflows to the north, the area is approximately 500,000 acres. All unused flow of the drainage area from Kings River south, excepting the part of Kings River discharge which flows directly to the San Joaquin River through the sloughs to the north, reaches Tulare Lake. Since the settlement of the valley the lake surface has varied from overflow stage to entirely dry, the last overflow being caused by the floods of 1861-62. Since then it has fluctuated, gradually declining until in the summer of 1905 it was entirely dry. As the area of the lake decreased, the exposed land was settled and farmed to grain, practically the whole area at one time being cultivated. The high run-off of the streams in 1906, the discharge being twice the mean, caused the lake to rise, submerging 300 square miles including much grain and improvements. The lake continued to rise until 1909 and has since been slowly receding. Increase in diversions for irrigation will prevent the flow of water to the lake in any but small quantities except in years of excess stream flow, such as 1906. The recurrence of such stream conditions can be expected more or less periodically. Such years as this will always cause the accumulation of much water in the lake bed, unless provision is made in the Kings River channels for diverting these flood water to the north to San Joaquin River, which is considered to be physically feasible. The cutting of the Kings River delta and the draining of Tulare Lake to the north for the irrigation of lands on the west side of the San Joaquin Valley was at one time contemplated, but the uncertainty of the supply has caused the abandonment of this project. At present much of the original lake bed is cultivated, the present lake being partially restrained by levees.

The present irrigated areas are supplies most largely from ground water resources. Development has been largely under the colony system, the wells being constructed for the whole colony and the land then sold in small tracts. Both artesian wells 900 to 1,600 feet deep which yield from 5 to 40 miner's inches of water each[1] and shallow wells which are pumped are used. Alfalfa, grain, and vegetables are the principal crops, a considerable acreage having been used for sugar beets. The underground waters here are part of the general valley body and should be capable of much use without exhaustion, although some wells formerly flowing now require pumping. Irrigation here is independent of the variations of stream flow, water being available as needed, permitting the more intensive and profitable cultivation. Development has taken place most largely along the eastern portion of the area where transportation facilities are better. Further increase here as well as in the southern part of Kings County is to be expected.

VALLEY LANDS WEST OF TULARE LAKE.

These lands totaling 119,000 acres comprise Kettleman Plains, McLures Valley, and the west-side areas in southwestern Kings County. Like the west-side areas farther to the south they are practically devoid of a water supply, the surface run-off of the tributary drainage area being negligible in amount and the underground supplies being, so far as is known, of great depth, small quantity, and doubtful quality. Any irrigation, except possible along the margin of Tulare Lake from artesian supplies, or any agricultural use of this area cannot be considered practicable by any present standards or knowledge.

KINGS RIVER AREAS.

In the agricultural area dependent mainly upon Kings River for a water supply, extending from Kaweah and Tulare Lake areas on the south to San Joaquin River and San Joaquin and Kings River Canal on the north, there are a total of 1,936,000 acres of valley and 83,500 acres of east-side plains, of which 704,140 and 2,350 acres, respectively, are reported irrigated. Of the irrigated area 628,780 acres are supplied by gravity canals from Kings River, 34,100 acres by pumping from underground supplies, and the remainder from San Joaquin or west-side canals. For convenience of discussion the total area is later separated into six divisions.

Kings River has built a delta which with that of Los Gatos Creek on the west side reaches across the trough of the San Joaquin Valley forming a barrier over which, in recent times, the streams to the south have rarely been able to flow. The ease with which the river can be diverted and carried to various delta lands has led to a larger irrigation development than that from any other single stream in the State. Much of description and investigation has been published concerning the various phases of this development.[2]

Kings River is one of the three largest streams in San Joaquin Valley, the twenty-one years of published records showing a mean annual run-off of 2,650 cubic feet per second, equal to 1,920,000 acre-feet per year.[1] May and June are the months of highest flow, averaging about 8,000 cubic feet per second. The mean discharge in September falls to 460 cubic feet per second. The annual variations in discharge are similar to other San Joaquin Valley streams, the maximum annual discharge being twice and the minimum annual discharge a little less than one half of the mean. During high stages the flow of the river divides, part following the main channels to Tulare Lake and part the sloughs to the north, finally reaching San Joaquin River. In years of low or medium flow but little water is unused, but in years of large flow a considerable amount is undiverted.

[1] U. S. Geol. Survey Water Supply Paper No. 222.

[2] U. S. Dept. Agr., Office Expt. Stas., Buls. 100, 217, 237, and 239; U. S. Geol. Survey, Water Supply and Irrig. Papers Nos. 18, 52, and 222; U. S. Dept. Agr., Bureau of Soils, Soil Surveys of Fresno and Hanford areas.

Irrigation first began from Kings River in the early sixties and has increased until at present 628,780 acres are reported irrigated out of a total area under constructed systems of 800,000 acres. Much litigation has arisen over water rights, present diversions being made chiefly under agreements among the larger companies which have been embodied in court decrees, the tendency of continued litigation having been to cause combinations of canal systems and compromises as to water used.

The natural flow of Kings River is diverted directly to as great an extent as is practicable. Any large additional canals under present conditions would receive water for too short a period during high stages for their construction to be feasible, unless the water supply can be supplemented from storage or pumping, and except as it is found feasible to use water in spring only. The rise of ground water is causing the use of less water in many cases, thus allowing additional areas to be served, although the difficulties with drainage tend to balance this advantage, so that no extensive increase in area can be anticipated from the direct use of natural flow. The most favorable opportunities for increase are by pumping from the underground waters and by the storage of the unused flood flow. But little good land remains unirrigated on the east side of the valley and any large new supplies which are developed will probably be carried to the west side. The possibilities for storage of flood flows have been investigated and reservoir sites with a total capacity of 340,000 acre-feet reported,[2] a water supply being considered available for the various reservoirs. By increasing the height of the proposed Pine Flat Reservoir to 270 feet, it is estimated that a storage capacity of 400,000 acre-feet can be obtained at practicable costs. The construction of such storage would permit either an increase in irrigated area, or furnish late season water to present areas, thus increasing the yield from alfalfa and other crops. Any attempt to store flood waters in the Sierra under present water-right conditions except by agreements with present canal systems would probably be impracticable, because of the litigation which it would be liable to provoke.

The development and use of underground water will be the source of the greatest increase in the area irrigated from Kings River. Continued irrigation has raised the groundwater until it has rendered much land unfit for cultivation, so that the removal of this water for use would be of twofold advantage. The quantity which it will be practicable to develop cannot be estimated until it has been at least partially tested. In drainage investigations which were made in 1906[1] it was estimated that the annual removal of three quarters of a foot in depth of water over an area of 200,000 acres in the vicinity of Fresno would relieve the harmful conditions at that time. Considering the delta as a whole it is probable that 300,000[2] acre-feet or more will be annually available by pumping, or sufficient for the irrigation of 120,000 acres or over at a duty of 2.5 acre-feet per acre. The use of this drainage water on the west-side valley has been projected, although it is not known how much of this ground water it will be practicable to recover. The irrigation census of 1909 reported 888 pumping plants in Fresno County and these are being increased rapidly, the largest number being in the vicinity of Fresno. Artesian flow can be secured in the lower valley lands extending from the Kings River to the San Joaquin. In general, ground water can be secured at lifts of 30 feet or less, in some portions of the lower delta water occurring within reach of plant roots, which condition has caused much damage from alkali. The pumping of ground water would be of general benefit to the lands now affected by high water-table, and is the more probable means by which any future development will be undertaken. While at present the use of water during short periods of large supply may be excessive, the general average amount applied is not likely to be materially reduced, the mean annual flow of Kings River when divided by the area at present irrigated indicating a mean gross duty of about 3 acre-feet per acre, and in years of low discharge much less water is available. With a general and more definite determination of present rights the use of any excess flow either directly or by storage will become practicable.

ALTA AREA.

This area includes Alta Irrigation District, with its adjacent valley and plains lying north of the Kaweah area and south of Kings River. There are 147,000 acres of valley land and 39,000 acres of plains, of which 93,950 and 1,130 acres, respectively, are reported irrigated, Alta Irrigation District including 130,000 acres of the valley land, of which 90,000 acres were irrigated in 1912. The remaining valley land lies in small pieces along Kings River bottoms and also above the Alta canals. There are 2,200 acres irrigated from Kings River along the river bottom outside of Alta Irrigation District, the remaining 1,760 acres being irrigated from pumps. Alta District purchased and extended the canals and rights of the Seventy-Six Land and Water Company, the water rights of which call for 800 cubic feet per second. However, this is subject to other priorities, so that their supply usually ceases during July, some water being also received in October and November by agreement with earlier rights. Conditions vary from small, prosperous holdings in vineyards and fruit, as around Reedley and Dinuba, to lands needing drainage which furnish pasturage only, as around Traver. The district encountered many legal difficulties both as to water rights and district bonds, but these matters have now been arranged and the district affairs are in an improved condition. The use of water is excessive in many cases and the losses through seepage in the canal are high. An increase in the irrigated area with the present water supply should be feasible, as more of the land is placed in the better paying crops and more careful methods of irrigation are practiced. Underground water at shallow depths underlies the valley lands and can be pumped during the later season to supplement the canal water. Some of the lower parts of the district are seriously in need of drainage and by remedying this a continuation of the present rate of progress is to be expected. Citrus fruits are successfully grown on the higher valley and the plains land, water being usually obtained by pumping from the canals or from wells, the lifts from the latter generally varying from 50 to 80 feet. Further increase in the irrigated area should be feasible in the plains lands, although the amount of water which the underground supplies can furnish without depletion may be limited in the more unfavorably situated portions.

[2] U. S. Geol. Survey Water Supply and Irrig. Paper No. 58.

HANFORD AREA.

Lying below the Alta area on the south side of Kings River in Kings County and extending to the trough of the valley and to Tulare Lake one the west and south is an area of 226,000 acres, of which 159,360 acres are reported irrigated, the areas irrigated under the different canal systems being reported as follows: Peoples Ditch, 60,000 acres; Last Chance Canal, 35,000 acres; Lemoore Canal and Irrigation Company Canal, 30,000 acres; Lakeside Canal, 20,000 acres; Empire Canal, 12,000 acres; pumping from wells, 2,360 acres. All these canals obtain their supply from Kings River, except Lakeside Canal, which receives Kaweah River flood water. Much of this area is subirrigated and in many places on the lower lands the high ground-water level has caused much damage from alkali and water-logging. About one half of the acreage is in alfalfa and one half in trees and vines, the lower areas being used most largely for the forage crops and the higher lands in the vicinity of Hanford for the fruit crops. The soils are sand and sandy loams.[1] The canal systems are owned coöperatively, the amount of water received and the charges paid being proportioned to the amount of stock owned. It is through the lower portions of this land that the waste and flood waters of Kings River reach Tulare Lake. Artesian and pumping supplies underlie the areas at present unirrigated, and with more economic use of the flow of the canals, a water supply should be available for that part of the remaining unirrigated lands whose soil and drainage conditions make improvement feasible. With ground water so close to the surface, its control is as important as irrigation.

---

[1] U. S. Dept. Agr., Bureau of Soils, Soil Survey of Hanford Area.

FRESNO AREA.

The largest section irrigated from Kings River, which is generally referred to as the Fresno plains, lies between Kings and San Joaquin rivers, extending from the foothills on the east to the lower valleys and slough areas on the west. There are a total of 535,000 acres of valley land and 44,500 acres of plains, with 325,400 and 1,220 acres, respectively, reported irrigated. The Fresno Canal and Irrigation Company and the Consolidated Canal Company, which are under one management and form the largest single irrigation enterprise in the State, include 207,000 and 90,000 acres, respectively, of the area reported as irrigated. Water rights are issued by these companies on the basis of 1 cubic foot per second for each 160 acres, each right being for a proportional part of the flow in the canal and fixed on some specific tract of land. Second-class water rights have also been sold to waters possessed by the company in excess of the original appropriations. There is an annual rental charge of 62½ cents per acre under the Fresno system and 75 cents under the Consolidated, only water-right contract holders being permitted to receive water. Emigrant Ditch irrigates about 2,000 acres in this area, and the remaining 26,400 acres are supplied by pumps. The excessive use of water has caused the ground water to rise sufficiently high with its attendant alkali in some cases to kill trees and vines and much of the western part of this area is in immediate need of drainage. The soils are generally sandy, both the red or granitic and the white or ash soils occurring.[1] Hardpan is found at varying depths, being less than 3 feet below the surface on portions of the plains and higher valley lands.

This district is particularly noted for its raisins, raisin grapes being the predominating product, and table and wine grapes, deciduous fruits, alfalfa, and pasture the other principal crops, the alkali and lower lands being largely used for pasture.

The area is quite completely developed at present, many pumping plants supplying water to supplement the canal water in the low water season, as well as to entirely supply lands which receive no canal water. Any large increase in irrigated area by new projects is not to be expected, as the remaining unirrigated lands lie chiefly in the lower valley where soil conditions are not as favorable as on the unirrigated lands of the west side, where any large future water supply is most likely to be used. The removal of ground water for use elsewhere or for drainage purposes alone would be a material improvement for large areas, and is the most probable course of development. Higher canals covering the plains land are not probable and it would seem that future irrigation there as at present will mostly be confined to the use of the very small local run-off and to water pumped for citrus fruit, the extent of the underground supplies under the higher portions being largely untested.

---

[1] U. S. Dept. Agr., Bureau of Soils, Soil Survey of Fresno Area.

MURPHY SLOUGH AREA.

Lying north of Kings River in the lower valley and along the sloughs leading to San Joaquin River is an area of 135,000 acres, of which 77,840 acres are irrigated as follows: Laguna de Tache canals, 30,000 acres; various canals of Summit Lake Investment Company, 14,880 acres; Crescent Canal, 11,840 acres; Stinson Canal, 10,080 acres; Millrace Ditch, 3,840 acres; Liberty Canal, 4,640 acres; and Reed Canal, 2,560 acres. While some of these systems are among the oldest diverting water from Kings River and the areas irrigated have not changed materially for some years, the area irrigated is now being increased by the Summit Lake Investment Company, which is engaged in reclaiming land north of Summit Lake in the vicinity of Lanare. Alfalfa is the most important crop in this section, stock raising and dairying being largely followed. This section consists largely of the lower valley lands, and the high ground water and lack of adequate drainage have caused much damage from water-logging and alkali and prevented the successful raising of trees and vines in some portions of the area. With care in the use of water and drainage where practicable, a considerable increase in the irrigated area should be feasible both from canals and from underground sources, although it is not to be expected that the intensive and highly developed agriculture such as is found around Fresno will become general here.

JAMESAN AREA.

Lying along the valley trough north of the Murphy Slough area and extending to the lands irrigated from San Joaquin River canals is an area of 130,000 acres, of which 43,000 acres are reported irrigated, 29,000 acres of grazing land being flooded from Fresno Slough when Kings River is high. Of the land irrigated, 10,500 acres are in Tranquillity Colony, the James ranch including the flooded grazing land only. A water supply for 1,300 acres on the Borland ranch and for 4,500 in Tranquillity Colony is obtained by pumping from Fresno Slough. One thousand acres on the Mowrey ranch receive water directly from San Joaquin River through Herminghaus Ditch. The water pumped from Fresno Slough is in part backwater from San Joaquin River and in part flood and waste water from Kings River, depending on the relative stages of the two streams. General conditions are similar to those in the Murphy Slough area, alfalfa, corn, grain, and pasture being the principal crops. Further development of the portions of this area where soil and drainage conditions warrant should be feasible, the land lying so as to be susceptible of irrigation from either Kings or San Joaquin River. With the exception of the Tranquillity Colony, the land is held in large tracts mainly by the James and the Miller & Lux interests. Pumping plants obtaining water from wells are used to irrigate 1,220 acres near Mendota, the deeper and partially artesian supplies being used.

WEST-SIDE LANDS NORTH OF TULARE LAKE.

Lying north of Tulare Lake and extending through Fresno County between the lower valley lands and the edge of the west-side hills is a broad strip of arid land containing 763,000 acres, of which only 4,580 acres are irrigated by the local west-side streams. The valley land on the west side of San Joaquin Valley is not as broad as that on the east, the larger amounts of débris brought down by the eastern streams having carried the valley trough west of the center of the valley. But little development has taken place on this side because of the lack of an adequate water supply. The local streams rise in the generally low and barren Coast Range, the precipitation on which is small and the run-off torrential and unreliable. The ground water underlying the area is generally too alkaline for either plant or stock use, besides occurring at great depth and being of small quantity. All agricultural conditions except water supply are very favorable, and several methods of obtaining water have been proposed. This area comprises the largest body of these west-side lands and lies above the reach of gravity canals which might be carried across Kings River delta. Kings River must be depended upon for any water supply of considerable quantity, although the San Joaquin River might be available for a portion of the northern end. Los Gatos and other small creeks carry some irregular flood flow which it may be feasible to store and use through quick flooding for the irrigation of some small areas, as is being done by the Belmore Land and Water Company on Panoche Creek, where 4,000 acres are being irrigated. The total area, however, which can be developed must be small. The use of underground water as at present known cannot be relied upon. As shown in the discussion of Kings River the surface flow of this stream is quite largely diverted, the only opportunities for obtaining a supply from Kings River being either by using Sierra storage or by the pumping of underground water in the Kings River delta and pumping again from the valley trough. The quantity of these underground waters which can be developed cannot be estimated closely. Kings River delta is underlaid at small depths with a comparatively abundant supply of underground water and it may be feasible to recover much of this. It is not improbable that one quarter of the flow of Kings River reaches this underground reservoir, although there is no definite basis available on which an estimate of this can be made. One quarter of the total mean flow would give nearly 500,000 acre-feet annually, or sufficient for 200,000 acres at a duty of 2.5 acre-feet per acre. The use of this water would require pumping from scattered wells on the east side, conveying to the valley trough and raising to the points of use on the west-side lands, so that the recovery of over one half to two thirds of this is all that may be expected. Investigations of the possibilities of irrigating the lower portion of these lands by these means have been made and the construction of systems of greater or less extent is probable. The quality of the soil, freedom from underlying hardpan, even slopes, and climatic conditions would make this land very attractive if a water supply can be provided, and these agricultural advantages are considered to be sufficient to make feasible the additional cost of conveying the water across the valley trough. The elevation of the highest point in the valley between Kings River and Los Gatos Creek delta fans is approximately 210 feet. Lying between the limit of gravity canals from the valley summit and the 250-foot contour are over 200,000 acres, while probably 150,000 acres more lie below the 300-foot contour. Owing to the length of canals necessary to reach all of this land, the actual lifts required would be in excess of that indicated above, but there should be sufficient land at a feasible lift to utilize whatever water supplies may be secured. The remaining and larger part of this area must be considered as non-irrigable by any present standards of cost and water supply, the highest portion being over 150 feet above the center of the valley and any water supply which may be secured will not be sufficient for even the lower areas.

AREAS WEST OF SAN JOAQUIN RIVER.

Lying west of the San Joaquin River largely below the San Joaquin and Kings River Canal and extending north to Tracy is an area of valley land of varying width and characteristics which is dependent practically wholly upon San Joaquin River for a water supply. The east side of the valley, while of much larger extent, is generally well supplied by the local Sierra streams, and with the exception of Madera County and the low valley lands is more easily irrigated by these tributaries. Unlike the west-side lands farther south, in this area gravity diversions can command the greater part of the area, although on the more northern lands it is probably more practicable to pump from the river than to convey the water in the long gravity canals which would be required. The local west-side streams are of small torrential flow and while they may be quite fully utilized through storage they can never supply more than a negligible part of the whole. San Joaquin River has been used more for the irrigation of alfalfa, grain, and pasture land and less for the higher valued orchard and vineyard products than the other streams. The high banks which border the river as it flows west to the trough of the valley have prevented its early diversion there and the ease with which it can be carried to the generally flat areas in the lower valley floor has made its use on these the more natural development. The owners of large holdings of Spanish-grant and swamp-lands have so largely controlled riparian rights as largely to control the flow of the river. Records of the discharge of the San Joaquin covering sixteen years are available.[1] These measurements were made at the edge of the foothills above any diversions. The mean annual flow for the full period has been 2,850 cubic feet per second, equivalent to 2,060,000 acre-feet per year. May and June are the months of greatest flow, the mean flow for June being 8,500 cubic feet per second. The flow decreases to an average of approximately 500 cubic feet per second from September to November. The total annual run-off in the year of maximum discharge of record was a little over one and one half times and in the year of minimum discharge a little less than one half of that of the mean annual discharge. Under present conditions the flow of San Joaquin River in its upper valley portions is quite fully diverted. Any further extensive diversions without storage could obtain water, if at all, for too short periods during high flow to enable crops requiring more than flooding to be certain of receiving sufficient water. The dependable part of the flow is now used quite fully for various crops but mainly for alfalfa and grain. That portion of the flood flow which is of short duration is used for flooding pasture lands either in natural overflow areas along the bottoms or by artificial methods. Any material increase in amount or value of the returns from the use of San Joaquin River water must come from a more economical use of present supplies or from the storage of the flood flow for use on crops of larger return than the pasturage at present irrigated. The acreage under present canals is being gradually increased and further economies will continue this increase. The storage of flood waters is probably physically feasible to a considerable extent, although no actual records of reservoir sites are available. The San Joaquin Light and Power Company is storing some water in the mountains and reservoir sites are reported to exist near Friant if feasible foundations for a dam can be secured. Unless such storage is undertaken by the controlling riparian owners, under the present conditions the legal difficulties will probably be greater than the engineering ones. There are areas lying above the flood limits and also above present irrigation, both on the west side and in Madera County, which can be covered by canals at a feasible cost if an assured water supply can be provided, and the use of the San Joaquin is as yet much short of its possibilities both in acreage and in value of crop returns.

---

[1] 1878-84, California Engineering Dept., Physical Data and Statistics, Wm. Ham. Hall, 1886; 1895-1901 and 1907-1910, U. S. Geol. Survey Water Supply Paper No. 299.

FIREBAUGH TO CROWS LANDING.

Extending from near Firebaugh to Crows Landing is an area consisting of the lands under the San Joaquin and Kings River Canal and the higher valley lands north of Fresno County, which includes 367,000 acres of valley land, of which 127,250 acres are irrigated. Also 40,000 acres of uncropped grazing land are flooded from branches of San Joaquin and Kings River Canal. San Joaquin and Kings River Canal, 72 miles long, with a total diverting capacity of about 1,550 cubic feet per second, is the largest of the canals diverting water from San Joaquin River. The total area between the canal and the river is 333,000 acres, of which approximately 50,000 acres consists of the lower-lying lands subject to more or less overflow, although this area may be increased in seasons of abnormally high water. There were 125,100 acres irrigated in 1912 under San Joaquin River and Kings River Canal, including both small holdings and lands of Miller & Lux, water delivered by the canal company being charged for on an annual rental basis.

The slough and overflow areas lie in the northern and eastern parts of the area. Waste water from the canal and flood waters from the river are used to flood the native grasses, large checks having been built which enable extensive areas to be irrigated quickly. Owing to their small elevation above the river and liability to flood, this use is perhaps the most feasible one for these lands, and the crop limitations due to these conditions will probably prevent any more intensive use being made of a large portion of this area as higher and more easily reclaimed lands are available elsewhere for all the dependable water supply which can be developed. The valley lands not subject to overflow and below San Joaquin and Kings River Canal consist mainly of Miller & Lux holdings and of colonies which have been sold by them. Alfalfa and other forage crops predominate, stock feeding and dairying being the main industries. The irrigated lands below the canal are generally flat, with clay loam soils predominating, which become heavier as the river is approached, considerable alkali also being found in the lower portions. Alkali reclamation is being successfully accomplished where a water supply for such purpose can be procured. Although the late-season water supply is less than desired, good returns are secured and the irrigated area is being continually extended by more economical use of the canal water.

Lying above the canal is a strip of valley land of 64,000 acres, varying in width from practically nothing west of Los Banos to strips from 3 to 8 miles long on the local creeks. Of this, 2,150 acres are irrigated by creeks and some by pumping from the canals. Much of the area in the northern part is dry-farmed to grain, some adjacent higher rolling land also being used for grain raising. Because of the difficulty of irrigating, even if a water supply were available, it is excluded from the classifications of this report. Practically the whole of these lands lie at elevations of less than 60 feet above the present canal and pumping would be feasible if the water is made available in the canal. Underground water occurs irregularly both as to quantity and quality, and at no place above the canal has a sufficient supply of good quality been found for use in irrigation. Although there are some wells supplying potable water for domestic use, the underlying water is generally deep, alkaline, and scarce. Various small torrential streams, such as Crow, Orestimba, Quinto, Romero, San Luis, Los Banos, and Ortigalita creeks, drain the coast range. Of the 2,150 acres irrigated above the canal from creeks, 650 acres are irrigated during the flood period from Los Banos and San Luis creeks, 1,300 acres from Orestimba Creek, and 200 acres from Crow Creek. A reservoir is being constructed on Quinto Creek from which it is planned to irrigate 700 acres. A site having a capacity of 17,500 acre-feet has been surveyed on Los Banos Creek, which will probably be ultimately developed, as the run-off from over 150 square miles of drainage area, having a rainfall of from 12 to 20 inches, is considered sufficient to fill the reservoir. The use of the various available sources will ultimately supply much of this higher area, the possibilities being much more encouraging than for the larger similar areas farther south.

CROWS LANDING TO TRACY.

This area, containing 143,000 acres of valley land, of which 6,200 acres were irrigated in 1912, extends from the lower end of San Joaquin and Kings River Canal to the delta and overflow lands at the northern end of San Joaquin Valley. While an extension of San Joaquin and Kings River Canal would cover some of this area, it is considered more feasible to pump directly from the river. Not only are the construction cost and seepage losses of long canals avoided by pumping, but the water supply available is increased by the excess water of the lower east-side tributaries and waste water from canal systems above. Even with the ultimately large uses of the streams in the San Joaquin Valley, waste and return water will always supply some flow in the lower river channels which will be available for use here. The even slope of the surface and tillable character of the soils makes the preparation of land for irrigation inexpensive. The soils are deep and while variable are generally of a sandy or clay-loam character. The non-irrigated lands are in large holdings. The only large present system is owned by Patterson Colony, which contains about 19,000 acres, of which 6,000 acres were irrigated in 1912. The project has been completed but a short time and the irrigated area is increasing rapidly. The water is pumped in four lifts, the equipment and canals being well planned and permanently constructed.

North of Patterson Colony, between the Southern Pacific Railroad and the river, lying at lifts of less than 40 feet above the river, are approximately 35,000 acres, of which probably 5,000 acres are subject to overflow. The remaining area above the railroad rises from 20 to 40 feet per mile away from the river and greater lifts will cover correspondingly greater areas. Some investigations have been made and the construction of further projects similar to that of the Patterson Colony may be undertaken. By storage, which may be feasible on a small scale, Crow and Orestimba creeks may be able to supply further small areas, but as a whole the development from them is likely to be unimportant. Small pump supplies may be found along the creeks as they enter the valley floor. Underground water, usually said to be of fair quantity, occurs in the lands nearer the river at low lifts. Ground water seems to have an elevation approximately the same as the water in San Joaquin River, the lifts increasing as the foothills are approached. The quantity which can be obtained in the higher areas has not thus far been sufficient for irrigation purposes. Ultimate development in this area will depend on the lifts which may become economical and upon the water supply which can be secured in San Joaquin River. The general agricultural advantages of soil, crops which can be raised, and available markets will in the end force the subdivision of this area into small holdings and full economic development of the water supply.

TRACY TO BAY POINT.

Lying above the overflow lands of the lower San Joaquin delta on the west side of the valley, there is a generally narrow strip of valley land extending from Tracy to Bay Point, which contains 66,000 acres, of which only a small area is now irrigated. Bay Point is taken as the end of the San Joaquin Valley. The local run-off from the small west-side creeks is similar to that from those farther to the south, being small, irregular, and requiring storage for any valuable use and the total area which they can supply being unimportant in proportion to the whole. All the favorable conditions for irrigation, such as good soil, even slope to surface, available market for products, etc., are present except the water supply. Underground water can be obtained only in the lower areas in the southern part, pumping supplies in some cases becoming brackish in the vicinity of Byron. Fresh water can be pumped from the various channels and sloughs of San Joaquin River as far down as the vicinty of Antioch. High canals from San Joaquin River, while topographically possible, would require too great a length to be really feasible. The elevation varies from 10 to 150 feet, over one half of the area probably lying at lifts of 60 feet or less above the river. The pumping of San Joaquin River water in the southern end of this area has been considered and eventually some development of this character is to be expected as the water supply is proven available. This area is quite largely cultivated at present in deciduous fruits, almonds, and grain, the returns from which would be materially increased by irrigation.

MADERA AREA.

This area covers the valley and plains land in Madera County between San Joaquin River and Chowchilla Creek, with 390,000 acres of valley lands and 112,600 acres of plains, of which 43,000 acres and 40 acres, respectively, of cropped land is reported irrigated. San Joaquin River, whose discharge is discussed under the lower west-side areas, is the principal tributary source of water supply. A considerable portion of the valley land in this area lies so that it can be covered by canals direct from the river; on the higher portions longer canals would be required owing to the depth of the river bed below its banks. Aliso and Blythe canals and Lone Willow and Brown sloughs covered 15,700 acres of cropped land in 1912 in this area. In addition they covered 45,000 acres of low pasture lands by flooding during high water, the area so flooded sometimes being as high as 100,000 acres. Chowchilla and Columbia canals are laterals from Lone Willow Slough. Gravelly Ford Canal is an additional canal that is being constructed for the irrigation of additional higher areas of these lower lands. The Madera Canal and Irrigation Company have about 40,000 acres under its system and irrigated 10,600 acres through it from Fresno River in 1912. Bliss and Sierra Vista canals, from Chowchilla Creek, irrigate 5,000 and 2,375 acres, respectively, and 9,621 acres were reported irrigated in

Madera County, mostly south and west of Madera, in 1912. The plains areas and non-irrigated valley land are largely dry-farmed to grain, the land being in large holdings. The soils of the area vary,[1] sandy and gravelly loam being the most frequent.

The only streams crossing the area for which discharge records are available are Fresno River and Chowchilla Creek, measurements indicating a mean annual run-off of 121,000 and 110,000 acre-feet, respectively.[2] Both annual and monthly discharges are subject to wide variations. The maximum discharge occurs from February to April, flow generally ceasing by June 1st. Any considerable use of these local torrential streams requires storage as only by this means can their irregular and uncertain flow be made dependable for use on crops requiring water later than May. The Madera Canal and Irrigation Company attempted to store the flood waters of Fresno River but was prevented by a court decison obtained by the lower riparian owners on the grounds that a riparian owner is entitled to have the normal flow of the river reach his lands.[3] This decision at present blocks any development by storage on these streams. On Chowchilla Creek, the proposed Buchanan reservoir site has an estimated capacity of 42,000 acre-feet. It is possible that it is feasible to store sufficient water on these streams to enable a large proportion of their flow to be advantageously used if the legal obstacles of the riparian doctrine can be overcome. The use of underground water has not, until recently, been as extensive in this section generally as in other parts of the valley, although, as already stated, a large acreage is now irrigated by pumping from wells south and west of Madera. According to studies by U. S. Geological Survey, practically everywhere within that part of Madera County west of the Southern Pacific except near the bluffs of San Joaquin River, underground water is available for pumping.[4] As the foothills are approached, depth to ground water increases and the lift necessary in their development increases correspondingly. Although much of this section will remain without an adequate surface water supply except through possible storage on the San Joaquin, it would seem that the use of ground waters will permit of the irrigation of several times the present area now served by pumping plants.

MERCED AREA.

This area includes the part of Merced County south of the Merced River, containing 361,000 acres of valley land and 112,000 acres of plains, of which a total of 41,895 acres are reported irrigated. In addition to this acreage of cropped-land arrigation, East Side Canal, in connection, with flooding from San Joaquin River, flooded 35,500 acres of grazing land, with 10,000 acres flooded from San Joaquin River below that canal and 2,000 acres flooded from Blythe Canal, all in 1912. Sometimes this total flooded area reaches about 60,000 acres.

[3] U. S. Dept. Agr., Office Expt. Stas. Bul. 239.

[4] U. S. Geol. Survey Water Supply Paper No. 222, p. 44.

Merced River is the only important stream crossing this area, although the San Joaquin forms the western boundary. Discharge records covering sixteen years are available for the Merced,[1] the mean annual flow having been 1,700 cubic feet per second, equivalent to 1,230,000 acre-feet per year. April to June are the months of highest discharge, the mean flow in May, the maximum month, having been 4,600 cubic feet per second. September is usually the minimum month of minimum discharge, the mean discharge for that month being 185 cubic feet per second. The total run-off in the year of maximum discharge of record has been one and three fourths times that in the mean year, and the run-off in the year of minimum discharge 0.4 that of the mean annual discharge.

Merced River, while diverted to a small extent to irrigate the narrow strip of bottom land between Merced Falls and Livingston, is used mainly on lands under the Crocker–Huffman Canal in the vicinity of Merced. There are 220,000 acres reported under the Crocker–Huffman Canal, of which 25,000 acres were irrigated in 1912. During this same season 4,700 acres were irrigated from pumping plants, and about 5,000 acres of pasture at the lower end of the Crocker-Huffman canal are flooded with surplus water from the canal. Water rights have been sold under this canal to cover something over 50,000 acres, this being the area classed as irrigated on the accompanying map. The principal irrigated sections at present are in the vicinity of Merced, Livingston, and Atwater. Water rights are sold for $10 per acre on an agreement to furnish one cubic foot per second for each 160 acres, but there has been little regulation of the quantity of water used and over-use in some cases is causing difficulties from the rising ground water. Except in the colonies, the holdings are generally large. A great variety of crops are grown, including forage, fruit, and truck. The various types of loams predominate in the soils, hardpan occurring at depths of from 3 to 10 feet in many parts.

Local streams besides Merced River for which discharge records are available are Mariposa and Bear creeks, the estimated total annual run-off being 33,000 and 47,000 acre-feet, respectively.[2] Like other creeks which drain small areas of the lower Sierra foothills, their flow is torrential and subject to great variations both annually and monthly. Maximum flow occurs from February to April, the streams generally ceasing to flow by June 1st. The flooding of wild grass pasturage near the San Joaquin is the only present use made of these creeks.

The only canal diversion from the San Joaquin River in this area is that of the Stevinson Colony, which includes about 12,000 acres, of which 11,500 acres of cropped lands were irrigated in 1912. In addition this canal distributed flood water for flood irrigation of about

[2] 1878–84, California Engineering Dept., Physical Data and Statistics, Wm. Ham. Hall, 1886.

36,500 acres of grazing land. Newman on the west side is the nearest railroad station. The soil is generally sandy loam and is adapted to a variety of products.

Extensive ground water supplies occur in the lower parts of this area, artesian flow being obtained west of the Southern Pacific main line, the lift generally varying from 15 to 30 feet on the remainder. As far as indicated by present scattered developments, the quantity of water gives promise of being sufficient to ultimately supply a considerable area.

Some storage sites have been surveyed on the upper portions of Merced River and others probably exist. With the use of such storage as can be secured, and by adapting the use to the seasonal variations of stream flow, it should ultimately be possible to irrigate at least the full area under the present systems and possibly more from gravity supplies. An area lying north of Merced River and above Turlock Irrigation District might be irrigated from the Merced.

MODESTO-TURLOCK AREA.

This division includes the valley and plains for which the Tuolumne River is the most natural source of supply. It extends from the Merced River on the south to the Stanislaus River on the north, excluding only a part of the plains area north of Dry Creek now largely included in Oakdale Irrigation District. The total area is 450,000 acres, of which 315,000 acres are classed as valley land and 135,000 acres as plains. Of the valley land 22,500 acres consist of low lands along the San Joaquin River and outside of the irrigation districts which are subject to more or less overflow, and about 14,000 acres along the Tuolumne and Stanislaus rivers. The area irrigated in 1912 was 135,760 acres, of which 38,250 acres were in Modesto District and 96,900 acres in Turlock District.

Tuolumne River, which is now used by Modesto and Turlock districts, has the largest flow of any tributary of the San Joaquin. Discharge records covering twenty-one years are available, the mean annual flow having been 2,870 cubic feet per second, equivalent to 2,080,000 acre-feet per year.[1] May and June are the months of greatest discharge, the mean flow then being about 7,600 cubic feet per second. This decreases until in September the mean flow is but 220 cubic feet per second. The run-off of the maximum year of record has been somewhat less than twice that of the mean year and that of the minimum year about one half of the mean. Underground water has been but little developed in this section, as the present gravity systems are already constructed for much larger areas than are irrigated. Some artesian flow is found in the lower portions, but it is not used for irrigation. Pumping supplies could be developed over practically all parts of the valley lands, although as the foothills are approached the lifts become greater and the total quantity which may ultimately be developed more uncertain.

---

[1] 1878–84. California Engineering Dept., Physical Data and Statistics, Wm. Ham. Hall, 1886; 1895–1910, U. S. Geol. Survey Water Supply Paper No. 299.

Modesto and Turlock Irrigation districts were organized in 1887, the former covering 81,143 acres north of the Tuolumne and the Turlock district covering 176,210 acres on the south side. Although separate in organization, they have a common diversion dam near La Grange. Their progress met with similar difficulties of a legal and financial nature and it was not until 1901 that the Turlock system began delivering water, the Modesto District following the year 1904. Alfalfa is the crop of largest acreage, over two thirds of the total irrigated area being in this crop. Deciduous orchards, grapes, and garden products are also grown. The soils are generally of a sandy character,[1] those south of the river being more sandy than those on the north.

To increase the water supply in the late irrigation season, a foothill reservoir having a capacity of 30,000 acre-feet has been built by Modesto District, and the construction of two reservoirs holding 50,000 and 60,000 acre-feet, respectively, is contemplated by Turlock District. Other available sites are known in the upper drainage basin, the general opportunities for storage on the Tuolumne being better than on the other Sierra streams. Drainage has been found to be necessary in some portions of the districts, the ground water having risen to damaging heights since irrigation was started. Some drainage work has been done. Above the districts there are about 44,000 acres north of the Tuolumne and about 135,000 acres south of it that are properly classed as plains. Much of these lands can be irrigated from the Tuolumne if the water of the river is not taken to San Francisco for municipal use. The rights sought to be acquired by San Francisco cover water on the upper drainage area, including storage on Cherry and Eleanor creeks and at Hetch Hetchy. With the dams planned the proposed storage will have a total estimated capacity of approximately 500,000 acre-feet and furnish a supply of 400,000,000 gallons per day, equivalent to 450,000 acre-feet per day.[2] Other reservoir sites of various capacities have been surveyed. The total annual run-off in 1897–98, the minimum year of record, was 977,000 acre-feet. This is less than the estimated requirements of the two districts and of the city of San Francisco, but as the plans of San Francisco include sufficient storage to carry over some supply for low years, both the districts and the city should be able to secure the water needed, particularly as but one year of the twenty-four during which records have been kept gave less than the total estimated as being needed. With the development of additional storage, both in the mountains and in the foothills, much of the fine plains area above the districts should ultimately be susceptible of irrigation, even if a municipal supply is taken from the Tuolumne to San Francisco. In only five years of the twenty-one years of record has the run-off of the river fallen below 1,600,000 acre-feet, and in ten years it was over 2,100,000 acre-feet, the maximum recorded discharge being 3,750,000 acre-feet. By drawing upon the underground water to supplement the gravity supply, the irrigation of a very large portion of the Modesto-Turlock area will be feasible if the Bay cities do not withdraw the large supply they are seeking.

---

[1] U. S. Dept. Agr., Bureau of Soils, Soil Survey of the Modesto-Turlock Area.

[2] Various reports submitted by City of San Francisco in the hearings on application for right of way in the Yosemite National Park for Hetch Hetchy reservoir site.

SOUTH SAN JOAQUIN-OAKDALE AREA.

This area covers the lands most feasibly irrigated from the Stanislaus River. This area extends from the Modesto-Turlock area north to the Mount Diablo base line and includes the South San Joaquin and Oakdale Irrigation districts which are now constructing new irrigation systems which will reclaim the greater part of their areas. The area included covers 129,000 acres of valley and 110,000 acres of plains, a considerable portion of the latter being an even second bench that is very similar in character to the valley land.

But little use for irrigation has thus far been made of the Stanislaus, 3,550 acres being irrigated by gravity supply from Stanislaus River and about 450 acres by pumping plants in 1912. Discharge records for the river covering 18 years[1] show a mean flow at Knights Ferry of 1,930 cubic feet per second, equal to 1,400,000 acre-feet per year. April to June are the months of greatest flow, May, the maximum month, averaging 5,000 cubic feet per second. September, with a mean flow of 180 cubic feet per second, is the minimum month. The total run-off in the maximum years of record has been twice that of the mean, the minimum year 0.3 that of the mean.

The owners of the land in the South San Joaquin and Oakdale districts organized in 1909 and after some difficulties in marketing their bonds have construction well under way. Both districts plan to have an entirely new irrigation system commencing with the season 1913. South San Joaquin District covers the land lying north of the Stanislaus and in the lower valley, while Oakdale District lies on both sides of the river above South San Joaquin and Modesto districts. The old Tulloch system, which irrigated land within the present boundaries of these districts, was purchased with its water rights by the districts in 1910. A storage reservoir to contain 75,000 acre-feet is included in the plans of South San Joaquin District. The upper Stanislaus is used to develop a considerable amount of power, some storage for which is being provided. The irrigation of areas lying north of that at present included in the district is probably physically feasible if a water supply can be provided. The joint canal of the two districts is to have a capacity of 1,700 cubic feet per second, which will require more than the full flow of the stream after June in normal years. The extent to which other areas can be supplied during the later irrigation seasons depends on the storage that can be provided. No large reservoir sites are known and the total amount which it will be practicable to store will probably be less than on the other streams, although it should be possible to supply more than the present 140,000 acres included in the two districts. Ground waters of excellent quantity, with lifts varying from 15 to 30 feet, underlie the valley lands of the area and can be used to supplement irrigation from gravity systems. Along the lower portions near San Joaquin River ground water stands sufficiently near the surface to make irrigation not necessary, and the plans of South San Joaquin District include drainage for these areas.

[1] 1878–84, California Engineering Dept., Physical Data and Statistics, Wm. Ham. Hall. 1886; 1895–1900 and 1903–1910, U. S. Geol. Survey Water Supply Paper No. 299.

STOCKTON AREA.

This area includes the valley and plains land in San Joaquin County exclusive of that in the South San Joaquin-Oakdale area and the delta lands and contains 256,000 acres of valley and 73,000 acres of plains, of which 13,320 acres of the valley lands are reported irrigated. Calaveras and Mokelumne rivers are the principal available sources of surface water supply, although now but little used for irrigation. Much of the lower half of the valley lands is quite intensively cultivated in orchards and vineyards. The benefits to be derived from irrigation have been the subject of much debate and as excellent returns have been secured without irrigation, the construction of large systems has been retarded. Irrigation is largely in small units of 5 and 10 acres which were first served by windmill and later by small engines. The soils are generally clay loams and clay adobe, hardpan underlying some portions at sufficiently small depths to influence crop growth.[1]

Calaveras River is a stream of irregular flow. Measurements made at Bellota from 1878–84[2] gave an estimated mean annual discharge of 520 cubic feet per second, equivalent to 377,000 acre-feet per year. Some records for 1907 to 1910, at Jenny Lind, are also available.[3] While the total annual run-off is perhaps not more variable than that of the other streams of the valley, the monthly and seasonal flow is much more irregular, separate months varying many hundred per cent in different years. April is usually the month of greatest flow, the discharge decreasing until the stream becomes entirely dry in July or August. The sudden floods on the Calaveras have been the cause of much damage to the city of Stockton, which is situated between two of the lower branches or sloughs. Protective measures are now being taken and storage construction in the foothills for flood protection is also contemplated. Any extensive use of the Calaveras River for irrigation will require storage. There is a site with an estimated capacity of 80,000 acre-feet which it is planned could be operated for flood control and also supply, when combined with the late natural flow, 50,000 acre-feet for irrigation. Such a system if feasible should be able to irrigate about 20,000 acres. Mokelumne River is a stream of comparatively large flow, yet the low discharge in the later irrigation season has as yet limited its use to the irrigation of about 2,200 acres. With storage a much greater use of this stream can be made. Discharge records covering 12 years are available.[1] These give an estimated mean annual discharge of 1,380 cubic feet per second, equivalent to 1,000,000 acre-feet per year. April to June are the months of highest flow, the mean discharge for May, the maximum month, being 3,640 cubic feet per second. September is the minimum month, the mean discharge having been 110 cubic feet per second. The maximum year of record has been one and two thirds the mean and the minimum slightly less than one half the mean.

[2] California Engineering Dept., Physical Data and Statistics. Wm. Ham. Hall. 1886.

[3] U. S. Geol. Survey Water Supply Paper No. 299.

But one system, that of the Stockton and Mokelumne Canal Company, diverts water from Mokelumne River. This canal covers about 32,000 acres lying east of Stockton and Lodi, of which but 2,200 acres are receiving water at present. All the irrigated land lies less than 40 feet above tidewater, the underground water being within range of root penetration on the lowlands. The history of this canal system consists of a series of financial difficulties and changes in control, although the present owners have improved and developed it. Many pumping plants are also used in this section.

There are large areas of valley land lying east of the Stockton and Mokelumne Canal which are susceptible of irrigation by gravity from Mokelumne River. Many pumping plants are operating in this area and the number is being rapidly extended. Any intended use of the Mokelumne will require storage. Reservoir sites are at present known which are estimated to have a capacity of 180,000 acre-feet.[2] The benefits of irrigation are becoming better appreciated and further use of the water of this stream is probable. At present pumping from underground supplies is the largest source of water supply, the holdings being generally small intensively cultivated orchards or vineyards. While the northern end of the general artesian belt underlies this area it is but little used for irrigation, the quality being poorer and the quantity obtained less than in the areas further south. Ground water in good quantities is obtainable generally at lifts of from 15 to 30 feet in the valley lands. The area reported irrigated from pumps is 11,120 acres, the number of plants being about 1,500. Many of these plants are owned by foreigners, largely Italians, and while the new installations are being made in small units, in the aggregate the total increase is materially influencing agriculture in this section. The increase from 8,642 acres in 1909 to 11,120 in 1912 for areas irrigated by pumping is at the rate of 10 per cent per year. With underground water available in such large quantities and small lifts a continuation in the present rate of increase in use is to be expected. Eventually it is also probable that the flow of Calaveras and Mokelumne rivers will be utilized, more probably on the higher valley and plains lands where ground water is not so accessible.

SAN JOAQUIN DELTA AREAS.

The lower course of San Joaquin River is through an area of island and overflow land whose physical and agricultural characteristics are materially different from the general valley areas. This area includes the swamp land segregation from near Tracy and Lathrop to the north line of San Joaquin County and contains approximately 315,000 acres, of which 177,600 acres are considered irrigated by the standard adopted. San Joaquin River divides into 3 channels, Old River, the most westerly, Middle River, and the present San Joaquin, which passes near Stockton. The area between these channels, which unite near the mouth of the Mokelumne River, comprises about 120,000 acres, which is divided by the various sloughs and drainage canals into islands varying from 1,000 to 12,000 acres in size of which 89,000 acres are irrigated. Most of these islands have been reclaimed by the construction of levees to prevent overflow, the work being largely done by organized reclamation districts, and the reclamation of others is now in progress. The remaining unirrigated area consists largely of Bouldin, Madeville, and Bacon islands and various sloughs, lakes, and water channels. Efficient water transportation is furnished by these numerous channels.

The soils are composed of a mixture of silt and more or less decayed vegetable matter and are locally known as peat soils.[1] These are usually saturated at depths of 2 or 3 feet or less. Pumping plants are maintained both to pump water from the sloughs onto the land for irrigation and also for the reverse process of drainage. The usual method of irrigation is by the slow passage of water through ditches about 1 foot wide and 2 feet deep spaced 60 to 80 feet apart, these saturating the intermediate ground. Considerable alkali is present but its harmful rise is prevented by the low capillarity of the loose vegetable soil. Potatoes, beans, asparagus, onions, and celery are the most important crops, barley being also grown largely for rotation with potatoes. But little alfalfa is raised as the depth to water is not generally sufficient for deep root growth. The peculiar characteristics of these soils are quite fully utilized in the production of the crops for which they are best adapted. They are more affected by an over supply of water than by a scarcity and no development on the tributary rivers will ever be so complete but that waste and return flow will be sufficient for these lower areas.

Very similar to the islands between the channels of San Joaquin River are those between the main Mokelumne and the slough known as South Fork of the Mokelumne. About 20,000 acres are included in the three main islands, of which 13,000 acres are irrigated.

---

[1] U. S. Dept. Agr., Bureau of Soils, Soil Survey of Stockton Area.

There is also a large area lying above the main sloughs that is subject to overflow and merges from conditions similar to those in the islands to those of the non-overflowed valley land. There are about 75,000 acres of this land lying west of Old River in Contra Costa County and 100,000 acres lying east of the main channel of the San Joaquin and the South Fork of Mokelumne River. These areas are largely protected by levees and are cultivated by methods similar to those used on the islands, and no shortage of water is felt. The area at present irrigated is 40,600 acres in the eastern portions and 35,000 acres in the western. The reclamation of further areas is to be expected here.

SUMMARY.

The summary of the various separate areas gives a total of 6,530,000 acres of valley and 1,046,000 acres of plains of which 1,705,745 and 23,230 acres are reported as now irrigated. The total discharge of the measured streams, which includes all of importance, has been 11,516,000 acre-feet per year in years of mean run-off and 4,955,000 acre-feet in the year showing the minimum discharge of record. The quantity which may eventually be secured from ground water may total 5,000 cubic feet per second.

Any statement of the present area irrigated or estimate of the ultimate area which can be irrigated in San Joaquin Valley must of necessity depend somewhat upon the standards of classification which are adopted. The present practice varies from intensive cultivation and irrigation from concrete pipe and stands in the orange groves, as about Porterville, to the crude, unrestrained overflowing of low land pastures. Any understanding of the possibilities of future development in irrigation in this valley requires a broad appreciation of the variable factors which may make each of these extremes the most economic use under certain conditions, although the circumstances that make the lower grade methods the more economic ones at present can be largely remedied in the future.

The area given as at present irrigated is based on careful reconnaissances covering the whole valley, checked by the reports of canal companies and the census of irrigation, and should be substantially correct. Land which generally receives water artificially for the benefit of any crops that may be grown, including pasturage, is classed as irrigated even though in occasional years of low stream flow no water may be applied. Any discussion of the areas which may ultimately be irrigated involves many variables and depends quite largely on the personal point of view. Developments which now excite no unusual comment would have been impracticable a generation ago and prophesies involving conditions a generation in the future may be similarly in error. In looking ahead, however, the present has one advantage over the past in that tendencies have now been established whose continuance is reasonably certain and from which the possibilities can at least be approximated. Among these are the increasing value of land and the necessity for its utilization in such a way as to produce returns in proportion to its value; the growing appreciation of the advantages and needs of irrigation if these higher returns are to be obtained; and the approach of the amount of water used to the easily available supplies, this approach stimulating both the more careful use of present direct flow and underground waters, and the development of those as yet unused. All these tendencies, which even causual study shows must continue at increasing rates, make it evident that economic conditions will eventually force a full utilization of available irrigation possibilities.

It is on this basis that the estimates of the area which may ultimately be irrigated have been made. Not only will the acreage be increased but the character of crops grown will be improved, although it is possible that wild-grass flooding will always be the most economical use of part of the most variable part of the stream flow.

While the surface flow of the streams and the underground waters are rather closely related, the developments which will be made from each of these sources can best be discussed separately, because of the differences in the amount of available data relative to their quantity and in the factors which will influence their use.

The low-water flow of all San Joaquin Valley streams can be considered either as fully used at present or as being appropriated by projects under active construction, except the waste and return water in the lower San Joaquin River itself. This applies to the discharge in the later months of the irrigation season. As the flood stages of all streams draining the higher Sierra occur generally in May and June, much of the discharge during this period is undiverted. There are two methods of more fully making crop uses and the seasonal variation of streamflow more fully coincide; viz: by storage of flood discharge for use as desired and by adapting irrigation to the available water supply, which is really ground storage. Only the second of these methods has been used to any extent in San Joaquin Valley. While but few data regarding feasible reservoir sites are available for this division as a whole, the general conditions and such detailed surveys as are known make it reasonable to conclude that much reservoir capacity can be secured at feasible costs. That this has not been done has been due largely to legal conditions which make uncertain the rights of those storing water as against the rights of riparian owners, and also to the general climatic conditions which permit irrigation during most of the year. It has been cheaper to use water when available, expecting the soils to retain a portion of the amount applied for the use of the crops in the months of low flow, than to undertake the uncertainties of reservoir storage. With the value of water increasing, the stage is being reached where it will be more economical to store excess waters for application when most needed than to use the larger quantities necessary in ground-storage practice. While the use of water whenever available is much to be preferred to no use at all, the best returns from the valuable fruit and forage crops can not be obtained unless late-season irrigation can be secured. A general examination of the annual and seasonal variations of stream-flow in this division shows that even with the use of as much storage as can be considered feasible, not over two thirds of the run-off can be made available for use on the most desirable seasonal distribution. That so many of the streams have already passed this figure is evidence of the advantages of the present practice of adapting the amount used to the available supply. It is for this reason that the construction of storage will add to the value of the irrigated crops more than to the total acreage.

The table below shows the comparative use which is now being made of the different streams. The use of Kings River is the most complete, due to several factors, among which are the high ground water plane, the irrigation of a large area of vineyards which require little water, and the use of practically all flood and waste water on forage crops in the lower areas.

Table showing discharge of and areas irrigated by principal streams in San Joaquin Valley.

River.	Mean annual run-off. Acre-feet.	Run-off in minimum year of record. Acre-feet.	Area irrigated by stream at present. Acres.	Mean annual run-off in acre-feet divided by area irrigated.	Minimum annual run-off in acre-feet divided by area irrigated.
South of San Joaquin River:					
Kern	770,000	288.000	176.220	4.4	1.6
Tule	148,000	70,000	47,775	3.1	1.5
Kaweah	533,000	252,000	109,700	4.9	2.3
Kings	1,920,000	884,000	628,780	3.05	1.4
Totals	3,371,000	1,494,000	962,475	3.5	1.6
North from San Joaquin River:					
San Joaquin	2,060,000	924,000	[1]344,100	6.0	2.7
Merced	1,228,000	518,000	[2]67,800	18.1	7.6
Tuolumne	2,080,000	977,000	135,320	15.4	7.2
Stanislaus	1,400,000	389,000	4,800	--------	--------
Calaveras	377,000	174,000	------------	--------	--------
Mokelumne	1,000,000	479,000	2,200	--------	--------
Totals	8,145,000	3,461,000	554,220	--------	--------
Grand totals	11,516,000	4,955,000	1,516,695	--------	--------

---

[1] Includes 177,600 acres of delta lands partially supplied by run-off of tributary streams, but does not include 122,000 acres of pasture artificially flooded from San Joaquin River in 1912 or 68,000 acres of pasture naturally flooded in 1912 from the same stream. In normal years the pasture artificially flooded from San Joaquin River is about 14,000 acres more and the naturally flooded pasture 5,000 acres more.

[2] Includes all lands holding water rights under Crocker-Huffman canal; only 19,500 acres actually irrigated under that canal in 1912.

While the same average of 1 acre irrigated for each 3 acre-feet of mean annual run-off may be attained on the Kern, Tule, and Kaweah rivers as on the Kings, it is hardly to be expected on those farther to the north where, so far as is known, the same opportunities for utilizing flood-flow do not exist. This average may be attained on the main San Joaquin, exclusive of its tributaries, if the delta lands are included, by the use of pumping to the northern west-side valley areas and further use in the upper portion through storage. At present the streams from Kings River south average 1 acre irrigated for each 3.5 acre-feet of mean annual run-off. While the utilization appears to have approached the economic limit on these streams, storage and prevention of seepage losses in canals and stream beds should permit some increase in area. By including the minor streams not in the table, the total discharge of the streams from Kings River south in mean years is 3,820,000 acre-feet which at a duty of 1 acre for each 3 acre-feet would supply 1,270,000 acres by gravity. On Kings River, the area irrigated may be increased through storage and improvements in canals, so that the streams in this portion of the valley may be estimated as capable of supplying a total of 1,350,000 acres as a probable maximum. This increase should be accompanied by a large increase in crop returns due to more intensive cultivation, as it is only by such intensive cultivation that much of this increase will be economically practicable. As this is only about one third of the available agricultural land, no detail study as to whether land and water can be brought together is needed. The streams are distributed so that ample land is available for each source and it is only on the west-side lands that no part of large continuous areas will be irrigated.

While the division between the streams from Kings River south and the San Joaquin and its direct tributaries is a natural one, the individual differences between the northern streams and their agricultural areas make a more detailed consideration of the possibilities advantageous. As shown by the preceding table, the use of these streams is much less complete than the use of the southern ones. This has been due most largely to the greater possibility of obtaining fair returns by the dry-farming of grain. With the greater returns of irrigation now fully appreciated, full utilization of the opportunities is to be expected.

The San Joaquin is the river of next to largest discharge and of largest present use in the northern part of the valley. As shown by the average of 1 acre irrigated for each 6 acre-feet of mean annual run-off, this stream should be capable of supplying a much larger area. Such an increase is to be expected eventually, for while much of the tributary land is now perhaps best adapted to grain and forage crops irrigated by wild flooding, yet there is sufficient land capable of intensive cultivation on the lower west side and in Madera County to fully utilize its discharge. There is also a greater opportunity to make use of any flood or waste waters on this river due to its greater length. Besides the run-off of its own mountain drainage, it receives the excess of the east-side streams which are available for use in the lower delta lands. Considering these delta lands as part of the area irrigated from the San Joaquin, a general duty of 1 acre for each 3 acre-feet of mean run-off should be attained, or a total of nearly 700,000 acres. The present conditions of ownership of riparian lands and control of water rights will probably postpone any such complete utilization of this stream, although eventually the value of its use should force the full economic development.

Tuolumne River is slightly larger than the San Joaquin. It is the only stream in the valley whose discharge is capable, when fully utilized, of irrigating its adjacent valley and plains land. The mean annual run-off can supply the 473,000 acres of agricultural land reported available at the rate of 4.4 acre-feet per acre. As the opportunities for storage are considered better than on any other Sierra stream, the Tuolumne can be considered as capable of irrigating this full area and also supplying some municipal water supply for the Bay cities, although the ultimate diversion of 400,000,000 gallons per day for use by the cities of San Francisco Bay, as now estimated to be required, will leave a mean annual run-off of 3.5 acre-feet for each of the 473,000 acres of agricultural land or only 1.1 acre-feet in minimum years.

Of the other streams, the Stanislaus and Merced rivers are the most important. Although present use is not large from these, constructed systems can serve much additional area. It is hardly to be expected that as large an area proportionately will be irrigated as on the southern rivers, as rainfall conditions are more favorable. Stanislaus River should irrigate the 140,000 acres of the two present districts and eventually additional area to the north. The irrigation of 300,000 acres from this stream would be at the rate of 1 acre for each 4.5 acre-feet of mean annual run-off and should be feasible when the demand for its use arises. A somewhat larger use of Merced River is probable as irrigation is more necessary in this portion of the valley, and 300,000 acres may ultimately be irrigated.

The only other stream of large run-off is the Mokelumne, which as yet has been little used. While agriculture without irrigation or irrigation by pumping is already well established in its tributary areas, so that its use will be slower than on the other streams, it can be considered as capable of ultimately irrigating probably 100,000 acres. The other various streams have a total mean annual run-off of 668,000 acre-feet. Calaveras River furnishes over one half of this and with storage may supply 40,000 acres. The remaining run-off is derived from the Fresno, Chowchilla, Mariposa, and Bear creeks in Madera and Merced counties and with storage may supply 60,000 acres.

Summarizing the various streams from the San Joaquin River north, the total area for which it may be estimated that a surface water supply may be obtained is 1,900,000 acres.

The above discussion covers the sources of surface water supply of San Joaquin Valley. The records of stream-flow furnish fairly complete data as to the available water from these sources, leaving only the extent of its use to be estimated. With the underground water both the quantity and its probable use must be estimated. A general description of the ground waters based on field work in 1905 has been published.[1] It is estimated in this report that the ultimate amount of ground water developed may be ten times that then developed in southern California, or 5,000 cubic feet per second.[2] At that time about 300 cubic feet per second was being developed in the San Joaquin Valley. This has been more than doubled since. If 5,000 cubic feet per second is obtained for 6 months of the year it will equal a total of 1,810,000 acre-feet or approximately 15 per cent of the total mean annual discharge of the streams at the edge of the valley. Considering the generally open structure of the subsoils the seepage of this amount or more can be considered as reasonable. Increase in gravity irrigation should increase the quantity reaching ground supplies. Groundwater in sufficient quantity for irrigation can be obtained in all parts of the valley proper, except in the west-side areas. In the lower valley floor artesian flow can be secured, although this is not extensively used for irrigation. While the quantities available decrease and the lifts required increase from the valley trough to the east-side foothills, the value of the products which can be grown increases, so that the highest development may be found in the regions of smallest groundwater supply. As pumping for irrigation requires both an initial cost and an operation expense that are plainly evident to irrigators, the pumped water is generally used more economically than that from gravity canals. As a large portion of the water at present pumped is used to supplement the water received from canals, it is not reasonable to expect the area irrigated from ground water will be entirely additional to that irrigated from canals. While any estimate of the total possibilities of the ground supplies must be liable to much uncertainty, the area eventually irrigated wholly by this means will certainly be several times that at present supplied and may reach a total of 600,000 acres. While use of ground water will be rather general throughout the lower valley floor and east-side plains, the largest use will be where gravity supplies are the least accessible, as in San Joaquin County, or where supplemental pump supplies are the most profitable, as in the Fresno district.

Any such extensive development as has been outlined both from stream and groundwaters can only occur by gradual increase through a long period of time, even with favorable legal and economic conditions. A large population is a first requisite for such intensive cultivation as will be required and settlers can not be obtained for such large areas in a short period. Removing all possible legal hindrances to legitimate development and uncertainties as to water-right conditions will hasten the time when the possibilities of this great valley may be realized.

---

[1] U. S. Geol. Survey, Water Supply Paper No. 222.

[2] It is understood that a new report is being issued by the Geological Survey on the underground waters of San Joaquin Valley and the preliminary estimates given in Water Supply Paper No. 222 are likely to be changed to conform to results of their later studies.

Summarized briefly, the situation may be stated as follows: In San Joaquin Valley from Kings River south are 4,662,000 acres of valley and plains land of which 1,136,910 acres are now irrigated and 1,650,000 acres for which it is estimated a water supply can be obtained. Of the agricultural area which must remain without a water supply, roughly 1,400,000 acres can be considered as being west-side and south-side lands and the remaining 1,750,000 acres as divided among the east-side areas. From San Joaquin River north are 2,914,000 acres of valley and plains lands with 592,065 acres irrigated and 2,200,000 acres for which it is estimated a water supply can be obtained. The areas which will remain unirrigated are scattered. Taken as a whole the valley and plains lands total 7,576,000 acres, with 1,728,975 acres irrigated and 3,850,000 acres irrigable. Present development is approximately 45 per cent of the estimated ultimate, and the estimated ultimate approximately 50 per cent of the whole area.

SIERRA FOOTHILLS ABOVE SAN JOAQUIN VALLEY.

The Sierra foothills in central California comprise a belt of land on the western slope of the Sierra Nevada bordering the San Joaquin valley and plains. The foothill territory covered in this report extends southerly from Mokelumne River to the Kern. Between the Kern and Tehachapi Mountains, at the southern end of San Joaquin Valley, the foothills rise abruptly from the valley floor and are followed by ranges gradually increasing in height until the summit of the Sierra is reached. The cultivable areas are found largely along the foot of the slopes or in small valleys or coves back of the first range of hills, as in the Tulare County citrus belt. This area south of Kern River is comparatively small and has therefore been included in the San Joaquin Valley plains. In investigating the arable areas in the foothills an altitude of 2,500 to 3,000 feet was taken as the upper limit, since above this irrigation is little practiced. The agricultural areas included are largely broken and scattered and while in some cases owing to topographic features and shallow soil no irrigation may be practiced, it has not been practicable to eliminate minor areas. The upper portions of the foothills are generally covered with a coarse growth of underbrush, small oak, and a second growth of yellow pine. In the lower portions adjacent to the plains grain is principally grown without irrigation.

The Sierra foothills have been so closely identified with mining that until recently little attention was paid to agricultural pursuits. Early miners who set out small orchards demonstrated the success of fruit-growing, but generally only enough fruit was raised to supply the local demand. Stock raising will always be an important industry. The lack of transportation has been a serious handicap to agricultural development and there are still fertile sections whose products must be hauled long distances to railroads. In many places ditches are already provided, having been constructed at an enormous cost for mining operations. Irrigation and the generation of power give new ways for the continued use of these ditches.

The streams which have their source in the Sierra constitute the available supply for the foothills as well as for San Joaquin Valley. The available discharge records and possibilities of the various rivers are discussed with the more important areas in San Joaquin Valley. Generally there are larger areas of valley lands available for each source than can be supplied. While the water resources may generally be considered as equally available for foothills or valley lands, extensive areas under single projects are not to be expected in the foothills, because of the generally broken character of the topography. Underground waters are not usually available, although springs are used to a certain extent.

The following tabular summary gives the location of the arable land in the foothills in central California by counties according to their location between the principal river systems, with the acreage of agricultural and irrigated land:

Summary of agricultural land in Sierra foothills above San Joaquin Valley.

Area.	County or counties.	Foothill agricultural land. Acres.	Areas irrigated. Acres.
Between Mokelumne and Calaveras rivers	San Joaquin	37,500	0
Between Mokelumne and Calaveras rivers	Calaveras	54,500	560
Between Calaveras and Stanislaus rivers:			
Lower foothills	San Joaquin, Stanislaus and Calaveras	115,000	40
Salt Springs Valley	Calaveras	47,000	100
Vicinity of Andreas and Angels Camp	Calaveras	15,000	570
Between Stanislaus and Tuolumne rivers:			
Lower foothills	Stanislaus and Tuolumne	46,000	40
Vicinity of Sonora	Tuolumne	81,000	2,300
Between Tuolumne and Merced rivers:			
Lower foothills	Stanislaus, Merced, Tuolumne, and Mariposa	53,000	0
Vicinity of Coulterville	Tuolumne and Mariposa	22,000	230
Between Merced and San Joaquin rivers:			
Upper Bear Creek drainage area	Merced and Mariposa	67,000	0
Upper Mariposa Creek drainage area	Mariposa	62,000	0
Upper Chowchilla Creek drainage area	Mariposa	50,000	40
Upper Fresno River drainage area	Mariposa	27,000	200
Madera County areas	Madera	18,000	40
Upper Kern River valleys	Kern	35.000	6,500
Totals		730,000	10,620

AREA BETWEEN MOKELUMNE AND CALAVERAS RIVERS.

This area comprises a total of 92.000 acres of agricultural land, of which 560 acres are reported irrigated from Mokelumne River and tributaries. Irrigation is confined to vegetables and small orchards, water being obtained from old mining ditches. In the lower foothills grain is grown without irrigation and conditions are similar to those in the adjacent San Joaquin plains. The mean annual rainfall at Mokelumne Hill at an elevation of 1,500 feet is 32.5 inches. All kinds of deciduous fruits can be profitably grown with irrigation. It is probable, however, that stock raising will continue to be the principal industry in this area.

AREA BETWEEN CALAVERAS AND STANISLAUS RIVERS.

This area, comprising 177,000 acres, has been segregated into three principal divisions. The lower foothills, including 115,000 acres adjacent to the San Joaquin plains, are utilized largely for grazing and the growing of grain. Salt Springs Valley, lying between Gopher Ridge and the Bear Mountains, forms the second group of 47,000 acres. The remaining 15,000 acres are found in the upper foothills between San Andreas and Angels Camp. The agricultural areas here follow along the creek bottoms, the hills being too steep and rocky for farming. Mining still predominates in the upper foothills, agriculture having been developed only to the extent of supplying local markets. The irrigated area in 1912 amounted to 710 acres, consisting mostly of small orchards and vegetable gardens. The soil is generally of a red clay or gravelly loam and when of sufficient depth is well adapted to the growing of fruit. Numerous ditches are already built capable of supplying a large area when the demand for irrigation is created.

AREA BETWEEN STANISLAUS AND TUOLUMNE RIVERS.

Lying between Stanislaus and Tuolumne rivers it is estimated that there are 127,000 acres of agricultural land, of which 2,340 acres are irrigated mainly by diversions from the South Fork of Stanislaus River. Owing to the more important industries of mining and lumbering there has been no real impetus to agricultural development. Farming is limited to the growing of grain and hay. The early miners set out a number of small orchards for the purpose of supplying fruit for domestic use. Where the trees received sufficient care, fruit of good quality was successfully grown.

The success of the fruit industry must depend largely upon irrigation. The soils are the result of the weathering or decay of underlying rocks, and on the hilltops it may be only a few inches deep. The average annual precipitation at Sonora for twenty-three years is 35.79 inches, almost all of which falls during the winter months. Owing to the shallow soils, steep slopes, and consequent natural drainage, very little of the moisture is retained in the soil for the dry season.

The principal water supply for irrigation is supplied by the Sierra and San Francisco Power Company, which has succeeded to the rights and properties of the Tuolumne Water Company. Water is diverted from the South Fork of Stanislaus River and delivered to lands in the vicinity of Sonora, Columbia, Jamestown, Soulsbyville, and Tuolumne. The charge for water is 12½ cents per miner's inch per 24-hour run. It is locally estimated that 24,000 acres in this territory are so situated that irrigation could be easily accomplished, and by constructing present known storage it has been estimated that water can be furnished for about 19,000 acres. The remaining areas are best adapted to grain and grazing. Transportation is afforded by the Sierra Railway, which connects Tuolumne with Oakdale on the Southern Pacific.

AREA BETWEEN TUOLUMNE AND MERCED RIVERS.

This consists of 53,000 acres of low rolling hills and 22,000 acres of scattered areas in the vicinity of Coulterville. Two hundred and thirty acres are reported irrigated. Conditions are similar to those in the area north of the Tuolumne River. The lower foothills are devoted almost exclusively to the growing of grain and grazing, and it is probable that in the higher foothills the stock industry will continue to predominate. A few oranges and lemons have been grown successfully for many years at La Grange, indicating what may be accomplished in time in favored localities of the foothills.

AREA BETWEEN MERCED AND SAN JOAQUIN RIVERS.

Soils in this area are chiefly of red clay loam characteristic of the Sierra foothills. The topography in general consists of numerous irregular plateaus separated by the narrow valleys of Merced River and Bear, Mariposa, and Chowchilla creeks, which are the principal streams. Merced River has a large run-off, but does not flow through the larger areas of agricultural foothill land, so its full use is more profitable in the main San Joaquin Valley. The run-off of the smaller streams is torrential and uncertain. Irrigation is confined to a few small gardens and fruit farms which depend upon springs and wells for their water supply. About 280 acres were irrigated from these sources in 1912. The agricultural area included in this group comprises 206,000 acres.

The only railroad which traverses this section is the Yosemite Valley Railroad, which follows along Merced River and connects with the Southern Pacific and Santa Fé railroads at Merced. Owing to the lack of transportation facilities, diversified agriculture has been limited to the demands of the local markets and any extensive irrigation development will be retarded until railroads are provided. In some cases, such as Chowchilla Valley, where soil and climatic conditions are adapted to special crops such as apples, local development may be important. Irrigation development as a whole will likely be slow, since the greater part of the available water may be had only after expensive storage works are constructed. Large areas of fertile land in the valley below which must look for their water supply in the Mariposa watershed will naturally be the first to be benefited. South of the Mariposa areas are 18,000 acres of foothill land in Madera County included in this division. The rolling hills are broken in numerous places by outcroppings of rock and are chiefly valuable for growing grain and grazing. It is doubtful if irrigation will ever be practiced, although the possibility of growing citrus fruits in sheltered portions may lead to some local development.

UPPER KERN RIVER VALLEYS.

The valleys of upper Kern River, while not distinctly a part of the Sierra foothills, have been included in this division. The area comprises about 35,000 acres, the greater part of which lies along the South Fork of Kern River at a mean elevation of 2,500 to 3,000 feet. Six thousand five hundred acres are reported irrigated, consisting mostly of alfalfa, wild grasses, and a few orchards. Kernville, Isabella, and Onyx are the principal towns and are reached by stage connecting with the Southern Pacific Railroad at Caliente. Stock raising and mining will always predominate. No great increase in irrigation can be expected in this section owing to the valuable hydroelectric power rights which have become vested on upper Kern River and its tributaries.

SUMMARY.

An estimate of the area which may ultimately be irrigated in this division is more difficult to make than in others of central California. The valley areas available are generally larger than can be supplied from the streams on which development in the foothills must also depend. The lower foothills, which comprise over one half of the total area, while similar to the valley plains are generally more rough in character and will probably be the last to be benefited by irrigation. In the upper foothills the agricultural areas are more scattered, and being smaller in extent it is doubtful if costly storage works would be justified for their reclamation. With better transportation facilities and a more general interest in diversified agriculture, it is safe to predict that from 40,000 to 50,000 acres may eventually be irrigated in the Sierra foothills above San Joaquin Valley.

VALLEYS EAST OF THE SIERRA NEVADA.

This division includes the portion of central California lying east of the Sierra Nevada and in the Great Basin drainage. The altitude of the agricultural areas varies from 3,700 to 7,000 feet, the streams arising at elevations of from 8,000 to 14,000 feet. In the valleys the available records of rainfall show a mean annual precipitation varying from 3.06 inches at Keeler to 14.49 inches at Bodie. The general agricultural characteristics are quite similar to those of the plateaus and valleys in northern California, forage crops and some grain predominating. Of a total area of 8,700,000 acres in the three counties, 472,000 acres are classed as agricultural and so situated as to be irrigable if a sufficient water supply can be procured, of which 137,760 acres were reported irrigated in 1911.

While this section has long been settled and irrigation has long been practiced, its fullest development has been retarded by the lack of adequate transportation facilities. The recent construction of a railroad to Owens Valley from the south has greatly improved this feature. The crops raised have been largely those consumable by the stock industry and as is usual in such cases the methods of irrigation are more crude than with the more intensive agriculture.

The separate agricultural areas are not numerous, as shown by the following table:

Summary of agricultural and irrigated areas in the valleys east of the Sierra.

Area.	County or counties.	Agricultural land. Acres.	Area irrigated. Acres.
Alpine County	Alpine	3,500	3,350
Antelope Valley	Mono	22,100	16,700
Bridgeport Valley	Mono	24,200	19,100
Area southwest of Mono Lake	Mono	19,000	2,720
Area north of Mono Lake	Mono	63,000	1,360
Owens River areas:			
Adobe Meadows	Mono	27,000	0
Valley north of Bishop	Mono and Inyo	77,000	260
Long Valley	Mono	21,500	18,700
Round Valley	Inyo	8,700	5,630
Owens Valley, Bishop to Aberdeen	Inyo	100,000	47,400
Owens Valley, Aberdeen to Owens Lake	Inyo	98,000	21,900
Owens Valley, west and south of Owens Lake	Inyo	8,000	640
Totals		472,000	137,760

ALPINE COUNTY.

Irrigation in Alpine County is confined to the valleys of the west and east forks of Carson River, 2,950 acres being irrigated from the west fork and 400 acres from the east fork. The former area extends from Woodfords to the Nevada line; the latter lies in the vicinity of Markleeville. But 3,500 acres are reported as being susceptible of irrigation from reported ditches. Forage crops predominate and general conditions are similar to those in the other larger areas of this division.

ANTELOPE VALLEY.

Antelope Valley, in the northern part of this division, lies at an altitude of from 5,000 to 5,500 feet and extends into Nevada along West Walker River, by which it is watered. Forage crops are raised almost entirely, meadow hay predominating. The Rickey Land and Cattle Company own the main part of the valley land and also the irrigation canals. Records of the discharge of West Walker River at Coleville gave a total run-off of 156,000 acre-feet in 1905 and of 490,000 acre-feet in 1907, the drainage area being 306 square miles.[1] The statement of the total area of irrigable land in this valley in California is based on the investigations made by the United States Reclamation Service, which contemplated using Alkali Lake as a reservoir for the irrigation of lands in Smiths Valley, Nevada. The total area of agricultural land reported in Antelope Valley is 22,100 acres, of which 16,700 are irrigated more or less completely, the area at present unirrigated lying above the canals and being of a generally rougher character. A water supply can be considered available for the total area, as with economy in present methods the amount now used would be sufficient. However, the irrigation of the remaining area is not considered probable for some time at least. Over-irrigation has caused the swamping of a large area in the vicinity of Topaz, and more care in the application of water as well as drainage in some portions is needed.

---

[1] U. S. Geol. Survey, Water Supply Paper No. 300.

BRIDGEPORT VALLEY.

Bridgeport Valley consists of 24,200 acres of agricultural land lying in the broad bottoms formed by Robinson, Buckeye, and Swager creeks and East Walker River, of which 19,100 acres are classed as irrigated, including about 1,200 acres in Huntoon Valley on upper Swager Creek, which is separate from the main area. The mean elevation is approximately 6,500 feet, meadow hay and pasture being the only crops raised. These are irrigated by the wasteful wild flooding methods prevalent in other similar areas where land holdings are large. The land classed as agricultural but not at present irrigated is in the upper portion of the valley along East Walker River and at the lower end above the irrigated land. A swamp area of about 4,000 acres caused by over-irrigation occurs in the valley and is excluded from the agricultural area. The water supply is more than required for all the agricultural land, its abundance having been the chief cause of its over-use. The irrigation of the remaining area, which is rougher and more rocky than the main valley, may be accomplished in time, although drainage of the swamps whose area is being increased, if economically practicable under present crop returns, is the most urgent need.

MONO LAKE AREAS.

Lying southwest of Mono Lake, in the vicinity of Rush and Leevining creeks, is an area of 19,000 acres, of which 2,720 acres are reported irrigated. Mono Lake, at an elevation of 6,400 feet, has an area of approximately 85 square miles, the evaporation from which is a measure of the run-off received. No evaporation measurements have been made on this lake, but at Owens Lake to the south and 3,000 feet lower in altitude it is approximately 70 inches, and at Lake Tahoe in the mountains to the north it is about 30 inches, so that the mean evaporation here may be estimated as 50 inches per year, equivalent to 225,000 acre-feet from an area of 85 square miles. Rush and Leevining creeks drain 150 square miles of the eastern slopes of Mount Lyell and the higher Sierra and are estimated to furnish one half of the run-off received by the lake. Many small lakes are formed along these creeks and by the use of some storage the water supply can be considered sufficient for the area reported. Its use is not probable, however, because of the climatic conditions, which largely limit agriculture to the growing of native hay, so that it is to be expected that this area will continue to be devoted at as present mainly to stock interests.

There is also an area lying north of Mono Lake containing 68,000 acres, 1,360 of which are irrigated. Mill and Wilson creeks are the principal streams and are used to supply the area at present irrigated. Mill Creek is one of the principal tributaries of Mono Lake, and with storage could be made to supply considerable additional area, general conditions being similar to those in the lands along Rush and Leevining creeks. The agricultural land lying in the eastern part of this area is backed by an arid drainage area of approximately 200 square miles, from which there is practically no surface run-off. The irrigation of this land can not be considered feasible, as because of climatic conditions the crop returns would not be sufficient to make any expensive systems financially successful.

OWENS RIVER AREAS.

The remaining areas of this division lie in the general Owens River drainage basin. Owens River receives the drainage from a length of about 100 miles along the east slope of the Sierra, its valley land comprising the largest agricultural area in this division. White, Inyo, and Coso mountains on the east yield but little run-off. Including Long and Round valleys, there is a total of 340,200 acres of agricultural land reported, of which 94,530 are irrigated. The mean elevation is 3,900 feet. The temperature at Independence ranges from 105 degrees to 3 degrees, the mean being 58 degrees, with a mean annual rainfall in the valley of approximately 5 inches. The 160-acre homestead is the typical holding and forage and grain are the principal crops, both alfalfa and native grasses being raised.

In 1903 the United States Reclamation Service carried on various investigations for the purpose of determining the feasibility of constructing further irrigation systems. Storage in Long Valley was contemplated. A reconnaissance of the lands in the main valley was made and it was estimated that there were 75,000 acres of first class and 50,000 of second class land requiring only water to be of value, 80,000 acres requiring drainage and washing, with 75,000 acres too rough for irrigation or waste land from other causes. The soils of the west side are derived from the Sierra and are granitic, those from the mountains on the east having a general limestone character. Over-irrigation has caused much of the bottom land to be affected with alkali. Drainage has been successfully tried on a few individual farms and more comprehensive systems should be feasible. The proposed project of the Reclamation Service was abandoned in favor of the Los Angeles aqueduct. The city of Los Angeles is building an aqueduct at an estimated cost of $24,500,000 to convey a mean flow of 430 cubic feet per second from the Owens River drainage a distance of 220 miles to provide for its future municipal needs. Large areas of land and five canals were purchased in Owens Valley in order to obtain their water rights. Storage in Long Valley is contemplated, other reservoirs along the aqueduct line also being included in the system. Diversion is made from Owens River, near Aberdeen, about 12 miles north of Independence, the capacity of the canal being 700 cubic feet per second at this point. This capacity is increased to 900 cubic feet per second as the various west-side creeks are collected and added to the canal. Haiwee reservoir south of Owens Lake will be used to equalize the seasonal flow, the capacity of the canal being 430 cubic feet per second below this reservoir.

Extensive hydrographic studies have been carried on in connection with this project, particularly in regard to the recovery of underground water. Much water seeps from stream beds and from irrigation ditches and irrigated fields which experiments have shown is now largely lost by evaporation from the lower valley lands, the depth to ground water fluctuating between 3 and 8 feet. By lowering this ground water below the effects of surface evaporation, it is estimated that a mean flow of 75 cubic feet per second can be developed. It is planned to use such waters as part of the Los Angeles supply, as the surface stream flow in some years falls below requirements. Artesian flow is secured in some deep wells bored near Independence. Underground water occurs in good quantities, with low lifts beneath the lower lands in much of the valley, and these sources may ultimately be used to some extent.

While the agricultural land is continuous throughout the main Owens Valley, it can be separated into sections for the purposes of discussion.

ADOBE MEADOWS.

The so-called Adobe Meadows comprise 27,000 acres of mountain upland used for spring range. Dexter Creek drains the low mountains to the west, but its channel does not extend across the meadows. There is no cultivation here, and irrigation is not probable, due to uncertain and insufficient water supply and other adverse conditions.

VALLEY NORTH OF BISHOP.

The valley extending along the railroad north from Bishop is supposed to have been the original course of Owens River.[1] There is no defined stream through much of this area and the only land irrigated is supplied from small creeks. There are 77,000 acres of this agricultural land north of present canals. While canals at higher levels might be built to cover some of the southern portion, it will not be feasible to irrigate the much larger part of the area.

LONG VALLEY.

Long Valley is the upper agricultural area reported on Owens River, including 21,500 acres, of which 18,700 acres are irrigated. All land along Hot and Convict creeks which is classed as agricultural is irrigated. Along the upper river there are about 2,800 acres of agricultural land which is above present irrigation. The land is held in a few large stock ranches and irrigation consists mainly of the flooding of meadows for hay and pasture. The altitude is 6,500 to 7,000 feet and the growing season shorter than in the lower valley. The irrigation of all agricultural land reported is feasible, but unlikely under present general conditions. The lower end of the valley will be flooded by the proposed reservoir of the Los Angeles aqueduct.

---

[1] U. S. Geol. Survey, Water Supply and Irrig. Paper No. 181.

ROUND VALLEY.

Round Valley, comprising 8,700 acres, of which 5,630 acres are irrigated, lies along Pine, Rock, and Horton creeks west of Bishop, at an altitude of 4,500 to 5,000 feet. In general characteristics it is similar to the main Owens River Valley. The tributary drainage area of 190 square miles furnishes sufficient water for all the land, that remaining unirrigated being generally too rough to have made its cultivation profitable up to the present time.

OWENS RIVER VALLEY, BISHOP TO ABERDEEN.

Extending from the vicinity of Bishop to just above the diversion for the Los Angeles aqueduct, near Aberdeen, is the main irrigated area of the valley. Of the 100,000 acres of agricultural land reported here, 47,400 acres are irrigated under both incorporated and private canals, Bishop Creek as well as Owens River being used. The Nevada-California Power Company has a power plant on Bishop Creek and partially regulates its flow by storage. Principal diversions in this section are by Owens River and Mesa Canal, Bishop Creek Ditch, Farmers Ditch, Upper McNally Ditch, Lower McNally Ditch, Rawson Ditch, Dell Ditch, Collins Ditch, Owens River and Big Pine Canal, Sanger Ditch, and by numerous small ditches on Bishop Creek that are within the Bishop Creek Water Users' Association. Present use of water is excessive and it is considered probable that by economical methods the water at present diverted can be made to irrigate most of the agricultural land in this portion of the valley. More economical methods of irrigation will also do much to relieve the rise of alkali over large areas of the valley land.

OWENS RIVER VALLEY, ABERDEEN TO OWENS LAKE.

From the aqueduct intake south to Owens Lake all irrigation not under control of Los Angeles receives its water supply from the tributary west-side creeks. Valley land below the aqueduct is practically controlled by Los Angeles, the city now irrigating to some extent under East Side and Stevens ditches. Surplus rights in the various creeks are controlled by Los Angeles and increase in irrigated area will depend mainly on more economical use under present acquired rights. There are 98,000 acres of agricultural land reported in this portion of the valley of which 21,900 are irrigated at present.

OWENS RIVER VALLEY, WEST AND SOUTH OF OWENS LAKE.

Lying west of Owens Lake is a strip of agricultural land extending as far south as Olancha, containing 8,000 acres, of which 640 acres are irrigated. The water supply is derived from local creeks, the run-off being less than that from similar streams farther north. Surplus rights are also controlled here by the Los Angeles aqueduct and much increase in irrigation is not probable.

SUMMARY.

Irrigation has probably reached nearer to its ultimate acreage in this division than in the other mountain sections of the State. Present practice follows the typically wasteful methods of the mountain meadows where water is generally abundant and where the native grasses are less injured by over-use than the crops of the more intensively farmed sections. There is a total of 472,000 acres of agricultural land reported that is topographically suited for irrigation, with 137,760 acres irrigated in 1911. In Alpine County, and Antelope and Bridgeport valleys, but a small portion of the agricultural area is unirrigated and the water supply is sufficient for the whole. The area southwest and northwest of Mono Lake should be capable of considerable increase in irrigated area if better transportation is provided. The areas northeast of Mono Lake and Adobe Meadows present but little possibility for irrigation and their inclusion in the classification of this report may be questioned. In the valley areas in the Owens River drainage a variety of conditions exist. In Long and Round valleys but little increase in irrigated area is to be expected as, while the water supply can be made to also serve the unirrigated agricultural land, the best of the meadow lands are already improved. In the area extending north from Bishop but little irrigation is probable except on such land as may be covered in the southern portion by higher Owens River diversions. In Owens Valley, extending from Bishop to Olancha, increase in irrigated area will come most largely through the more economical use of present acquired rights. Ultimately it may develop that it will be practicable to store water for local use in excess of the requirements of the Los Angeles aqueduct. Considering this division as a whole the increase of irrigated area from the present 137,760 acres to 200,000 acres would seem to be feasible, and ultimately, if more intensive cultivation of crops of higher return should become established, even this figure may be exceeded. The increasing injury of lower lands by over-irrigation, which is so noticeable at present, must be remedied, however, before a higher agricultural development can be expected.

SUMMARY FOR CENTRAL CALIFORNIA.

The following table resummarizes the agricultural and irrigated areas of central California and gives the areas it is estimated will eventually be irrigated in each main divison:

Summary of agricultural, irrigated, and estimated irrigable areas in central California.

Division.	Total areas of valley agricultural land. Acres.	Total areas of valley plains. Acres.	Total areas of foothill agricultural land. Acres.	Total areas at present irrigated. Acres.	Estimated area which will ultimately be irrigated. Acres.
Coastal valleys	887,000			82,000	200,000
San Joaquin Valley	6,530,000	1,046,000		1,728,975	3,850,000
Sierra foothills above San Joaquin Valley			730,000	10,620	50,000
East of Sierra Nevada	472,000			137,760	200,000
Totals	7,889,000	1,046,000	730,000	1,959,355	4,300,000

The standards adopted for the classification of the irrigable agricultural land and the present irrigated area are given in the introduction. The estimated areas which may ultimately be irrigated are discussed under each division and are based on consideration of all available information as to water supply, topography, soils, etc. While required information concerning many areas is at least partially lacking and present developments in many cases are not sufficiently complete to form the basis for an estimate of the total resources, yet it is believed that the total figures given for each of the four main divisions are fairly representative of their irrigation possibilities, and while their attainment may require a long continuation of the present rate of progress and may be retarded by present conflicting interests and lack of adequate legal control, eventually the financial returns from irrigation should force the fullest use of all available resources. The generally fair returns obtainable without irrigation in the coast valleys may make the full development slower in that portion, yet the high value of the agricultural products will justify the use of any methods which will increase the yields. In San Joaquin Valley the present rate of increase in irrigation is sufficiently rapid to furnish irrigated lands for all the new settlers who are being secured, and the construction of further systems can be expected to keep pace with the colonization demands. In the Sierra foothills increase will be slower due to the lack of transportation facilities and to the smallness of the separate areas. In the lands east of the Sierra increase in area will result from a more economical use of present supplies. With an area irrigated at present of 1,964,355 acres and with over 2,300,000 acres more whose irrigation can be considered feasible, the importance of any factors which materially influence the increase in use of these resources cannot be questioned. When the full significance of the population and the auxiliary industries which will be supported by such a development as it is reasonable to expect is appreciated, the direct interest of the State in all the problems of this development can be readily realized.

IRRIGATION RESOURCES OF SOUTHERN CALIFORNIA.

By C. E. TAIT,

Irrigation Engineer in Charge of Irrigation Investigations in Southern California.

INTRODUCTION.

The belief that the water resources of southern California are completely developed and used is erroneous. This is true for limited areas only. The waters of southern California are more fully used than those of the northern and central portions of the State or than those of other states, but development is not measured by the same standards as elsewhere. The highest duty of water, the most efficient and costly systems for transmission and distribution, and the most economical methods of application generally to be found in the irrigated sections of the United States are in this region. The agricultural industries include many of those prominent throughout the West, such as growing of alfalfa, grain, sugar beets, and deciduous fruits, the raising of live stock, dairying, and in addition, the growing of crops restricted to the semi-tropical climate of the Southwest, such as citrus fruits, English walnuts, olives, and Lima beans.

It is sufficient to say regarding lands that more territory remains unclaimed than water can ever be made available for and that these comprise areas where soil and climate are as favorable to agriculture as the best lands now being irrigated. The accompanying map shows the areas of agricultural and irrigated land, together with the more important irrigation canals. Practically all valley and agricultural land within the coastal drainage was formerly, and much of it is yet, embraced in Spanish grants. Under such condition, speculation in land begins with settlement. Nearly all of the deserts were originally Government land and settlement is under the national land laws.

Practically all reclamation has been by private enterprise. The most popular form of organization for the control and management of irrigation systems is the mutual water company, formed by landowners to provide water for their own use, and not for sale and profit. The area reclaimed by the Government is 16,500 acres and that irrigated under state irrigation districts is 15,500 acres.

A conspicuous feature of irrigation development in southern California is its rapidity, the water resources having been developed in spite of uncertainties regarding rights to use water. Storage has been discouraged more than other kinds of development, owing to the difficulty in determining the effect of storage in the mountains on pumping underground waters in lower basins. Investors have been willing to take chances on entering upon litigation and they have in many cases constructed works where it was known that litigation was inevitable.

While construction of irrigation works has been rapid, settlement of lands has kept pace with or been in advance of construction, and in this respect southern California is an exception to the general rule throughout the West. The experience has been the same on the coast and on the desert, whether the lands were public or private.

The development of electrical power has not been detrimental to irrigation in southern California, as power plants are usually located in mountain canyons above diversions for irrigation. In some cases the use of the water for power is beneficial in preventing loss by conveyance in pipes that would otherwise occur in the stream channels.

The surface waters were the first to be used. Pumping of underground waters then began in the older districts and portions of the flood waters were stored. The greatest activity in late years has been in pumping from wells. A great increase in irrigation is still possible from pumping and it remains for the flood waters to be much more completely conserved for the highest development of southern California's irrigation resources.

SANTA BARBARA AND VENTURA COUNTIES.

These are counties that have not so completely used their water resources as some others in the southern end of the State. This condition is accounted for in part by the fact that irrigation there is not altogether necessary for the successful production of crops. This division, and Santa Barbara County especially, in former years was one of less industrial activity than were the districts farther south. The owners of Spanish grants and large tracts have been slower to dispense with the comparatively free and independent life of grain growing and ranching on a large scale for the lure of greater financial profit in subdividing properties for sale and intensive culture. In this respect, this section partakes somewhat of the conditions in some of the large valleys of the northern and central parts of the State.

While it is true that very fair crops are secured in the moist atmosphere of the coast valleys, there is no longer doubt of the advantage of irrigation in either of the two counties. Formerly it was believed that English walnuts, near Santa Barbara, were better unirrigated, but experiments within the last few years have shown that the increased production and profits from irrigating the orchards more than compensate for the cost of irrigation. Even some oranges were grown without irrigation, and lemons alone were regarded as being unprofitable without water. With the success of the lemon industry has come increased interest in irrigation. Grain ranches and bean fields, even though beans themselves give good returns, are being replaced by lemon orchards where water can be secured for irrigation.

Development in Santa Barbara and Ventura counties depends largely upon the storage of flood waters. The first movement for storage will no doubt be taken by the city of Santa Barbara, owing to the need for more water for future growth. Santa Maria and Santa Clara River valleys and the Oxnard Coastal Plain are large areas where much extension of irrigation should result from pumping and storage.

SANTA MARIA VALLEY.

Santa Maria River flows westward to the Pacific coast, forming the boundary between San Luis Obispo and Santa Barbara counties. Nearly all the valley lies south of the river and in Santa Barbara County. The lower 15 miles of the river traverses Santa Maria Valley. The river's chief tributary, the Sisquoc, enters the valley at its extreme eastern end and joins the main stream on the south side.

Santa Maria Valley contains 147,000 acres of agricultural land, of which 11,441 acres are now irrigated. Most of the land holdings are from 80 to 160 acres, although there are a number of holdings exceeding 1,000 acres. Apparently the land has been formed by débris of the river filling a bay of the ocean. Some alkali is present near the coast, but much of this land may be reclaimed by drainage. A local sugar company is at present dredging a 20-foot open drain near the mouth of the Santa Maria which will reclaim about 1,000 acres of land now too moist for agricultural purposes, and has already drained 250 acres near Oso Flaco. This company also contemplates the drainage of 275 acres near Guadalupe in the western end of the valley.

Irrigation has not been regarded as necessary in this section and the water resources have not been very fully developed. Grain, lima beans, corn, and to some extent sugar beets have been grown successfully without irrigation. The sugar company supplies water to about 7,000 acres of land in the lower portion of the valley by pumping from wells and from Guadalupe Lake, a small body of water south of the river and having no connection with it and no outlet to the sea. This company also diverts water from the river in the upper portion of the valley. The Santa Maria Water Company takes water from the river for a small tract of alfalfa east of Santa Maria. The Sisquoc Water Company diverts water from the Santa Maria for the irrigation of alfalfa by means of a submerged dam. In addition to the crops already mentioned some deciduous fruits and garden truck are irrigated. Sugar beets are given one irrigation only, this occurring when the crop is about two and one half months old. Approximately 1 acre-foot per acre is used in the irrigation of sugar beets. The Union Sugar Company gives the cost of pumping water for this one irrigation from $2.80 to $3.77 per acre and the cost of water diverted from the stream about $1 per acre, also the cost of applying water from $2.50 to $4 per acre.

That portion of the Santa Maria above its junction with the Sisquoc is known as Cuyama River. This stream traverses mountain country throughout its entire course excepting one basin situated 30 miles back from the Pacific coast at an elevation of 2,200 feet known as Cuyama Valley. This basin includes 45,000 acres of agricultural and grazing land. Some grain is grown in the upper end of the valley but the greater part is devoted to grazing. The only irrigated land is one small tract in alfalfa supplied with water pumped from the river. Land holdings are large. Cuyama Valley is not reached by railroad.

The only available measurements of the Santa Maria are of 1904 and

1905. These are incomplete but show the discharge above the Sisquoc for 1905 to be about 61,000 acre-feet.[1] The watershed of the Santa Maria is 1,050 square miles and of the Sisquoc 530 square miles. The mean annual rainfall at Santa Maria for a 25-year period is 14.34 inches and is is probably 20 to 25 inches in the mountains where the elevations range from 500 to 6,500 feet above sea level. The river is subject to floods in winter and spring but becomes very low in summer. It is probable that further development may take place as result of storage of flood waters, although there is no definite knowledge of suitable reservoir sites. Santa Maria Valley is underlaid with an abundant supply of underground water as shown by wells already drilled and a large increase in irrigation should come from this source. Water stands in wells at depths of 15 to 30 feet in the lower part of the valley and at greater depths in the upper part. Practically all land in the valley should eventually be irrigated.

SAN ANTONIO AND LOS ALAMOS VALLEYS.

San Antonio Creek is the next stream south of the Santa Maria. It traverses in its middle course for a distance of 10 miles a long, narrow valley, the upper portion of which is known as Los Alamos and the lower San Antonio. Los Alamos and San Antonio valleys have an area of 15,800 acres. Large land holdings are an obstacle to rapid development by irrigation. There is very little irrigation on San Antonio Creek aside from the sugar beets of the Union Sugar Company of which there are 1,000 acres in Los Alamos Valley and 750 acres in San Antonio Valley. The beets are irrigated principally by pumping from wells but some of the water for those in San Antonio Valley is diverted from the creek. The surface flow of the creek during the irrigating season is small and the principal source of water must be the underground supply which appears to be plentiful. The watershed of San Antonio Creek is 140 square miles in area and the highest portions reach elevations of only about 1,500 feet. The watershed is of less value as a water producer than its area would indicate. No measurements of San Antonio Creek are available but its discharge is small. It is hardly probable that the irrigated area will exceed 5,000 acres.

SANTA YNEZ AND LOMPOC VALLEYS.

Santa Ynez River is the largest stream wholly within Santa Barbara County. It has a total length of 70 miles and flows westward to the Pacific, paralleling Santa Barbara Channel and being distant from it only 5 or 6 miles. The crest of the Santa Ynez range forms the dividing line between the drainage of the river and that to the Santa Barbara coast on the south. The principal tributaries enter the Santa Ynez from the north, draining a mountainous country which is an extension of the Coast Range. Practically all the valley land bordering the Santa Ynez is on the lower 18 miles of the river. There are two main basins, the lower one touching the coast and known as

---

[1] U. S. Geol. Survey, Water Supply and Irrig. Paper No. 177.

Lompoc Valley, and the upper one being separated from it by the Santa Rita hills and known as Santa Ynez Valley.

Lompoc Valley contains 29,300 acres of agricultural land of which only 1,590 acres are irrigated. Both heavy and light soils are found. The crops grown include mustard, grain, sugar beets, lima beans, onions, garden truck, and deciduous fruit. The rainfall at Lompoc is about 16 inches which, together with the moist atmosphere of the coast, permits crops to be grown without irrigation with fair results, so that land owners have been somewhat indifferent to irrigation development. The Union Sugar Company irrigates about 1,000 acres of beets by pumping from wells and from a stream. A few small tracts are irrigated from pumping plants. At one time plans were made to irrigate both sides of the valley from a dam on the river two and one half miles above Lompoc. Wells are from 30 to 70 feet in depth and the pumping lifts are low. Near the coast wells from 60 to 70 feet in depth flow. Santa Rita Valley is an eastern extension of Lompoc Valley. Burton Mesa borders the ocean north of Santa Ynez River and is devoted to grain growing and grazing.

Santa Ynez Valley has an area of 29,000 acres of land that may be classed as agricultural. The land is held principally in large tracts and grain growing and grazing are the main industries. About 60 acres of the Indian reservation near Santa Ynez is irrigated with water from Santa Cota Creek, and 25 acres of alfalfa near Los Olivas is supplied with water by pumping from a well. Plans are being made to irrigate 200 acres by pumping from wells. Underground water stands at a depth of 10 to 20 feet and a number of small wells are drilled 30 to 100 feet deep.

All of the discharge of the river in the dry season is claimed and used. The greater part of the watershed of the river is within the Santa Barbara national forest reserve. The precipitation varies from 20 to 25 inches throughout the watershed. Light snows lie on the higher peaks in the winter and spring. Measurements of the river near Lompoc from 1906 to 1910 show a mean annual discharge of 167,000 acre-feet.[1] The watershed above Lompoc is 785 square miles and the mean annual rainfall is estimated at 25 inches. Several good storage sites are located on the upper river and its tributaries, but it is probable that one or more of these will be utilized for the benefit of Santa Barbara by carrying the water through the Santa Ynez Range by tunnel. A considerable portion of Lompoc and Santa Ynez valleys may be irrigated from underground waters and the flood waters if stored and used in these valleys would be sufficient for all the remaining land.

SANTA BARBARA COASTAL PLAIN.

The Coastal Plain bordering Santa Barbara Channel has a southern exposure and stretches from Naples to Carpinteria with a total length of 30 miles and a width of from one half to three miles. Back of the plain is Santa Ynez Range. The plain is divided by hills into four parts. Beginning at the west these are: Goleta Valley, Santa Barbara, Montecito, and Carpinteria Valley. The entire coastal plain embraces 30,750 acres of agricultural land including 450 acres irrigated, together with other small tracts of irrigated land, the exact area of which is not known. This is a section of natural beauty, the valleys being broken by hills dotted with live oak and bordered with sand dunes along the coast. The climate of Santa Barbara is tempered by the sea and very equable. The winds are moderated by the mountains and by the Catalina Islands across the channel. The valleys are rolling and the soil varies in character from heavy loam to light sandy soil. Bays of the ocean once extended into each of the chief basins, these having now been filled by marine deposits and stream alluvium. This filling still continues at such places as Carpinteria and Goleta landing. Land bordering the sea marshes is strongly impregnated with alkali and will not have agricultural value for many years to come. Much of the land is held in tracts of from 5 to 40 acres, the small holdings being in orchard. There are some large holdings of several hundred acres devoted to grain growing in Goleta Valley.
